The forms of *Pyrus* of especial note just now include the Japanese Crabs, *P. floribunda*, of which the typical tree is a dwarf specimen 6 to 8 feet high with somewhat drooping branches, the flowers small, bright coral red in the bud, and tinted or white when open, produced with great freedom. Several varieties are represented, the most remarkable of which is *P. floribunda flore-pleno* (better known in gardens as *P. Halleana* or *P. Parkmanni*), with larger double handsome flowers borne in profusion along the branches. Three excellent garden varieties which appear to belong to this species, though I have not seen them at Kew, are ornamental both in flower and fruit—namely, *Transcendant*, *Fairy Apple*, and *John Downie*. The last named in particular is one of the finest Crabs grown for ornamental purposes and also for use. The American or Fragrant Crab, *Pyrus coronaria*, is past its best now, but when in full flower is an extremely beautiful tree of compact habit, with large white or tinted flowers, and far superior to the Siberian Crab (*Pyrus baccata* and its numberless varieties) from a floral point of view.

A stately and effective tree belonging to the *Aria* section of *Pyrus*, and closely related to the *Whitebeam*, is *P. Decaisneana*, the origin of which Mr. Nicholson says is unknown. It should be specially valued for its foliage, which, when stirred by a breeze, has a fine appearance, the under surface of the large, evenly elliptical leaves being of a glistening white, contrasting with the bright green upper surface. This tree is very little known in gardens or nurseries; in fact, it does not appear in one of the catalogues at my hand. Another little known tree, *Pyrus lanuginosa*, is noteworthy; it is included in the *Sorbus* section, and is a near relative of the *Mountain Ash*. The leaves are pinnate, with a broad terminal pinna, which gives a very distinct appearance to the tree. The flowers are white, in large cymose heads or corymbs.

Many others could be enumerated, but the "Plums" and "Cherries" demand a few words. The ornamental varieties amongst the true Plums are not very numerous. *Prunus communis* is represented by the variety *Juliana*, which is strong and moderately free. The double form of the common Sloe, *Prunus spinosa flore-pleno*, is also an attractive little tree in flower, but is very slow growing. One of the most telling trees in this section is *P. cerasifera* var. *atropurpurea*

(*P. Pissardi*), and though this is especially valued for its rich coppery foliage, it is very effective in flower early in the season.

In the *Cerasus* section of the genus *Prunus* are some of the handsomest flowering trees in cultivation. As examples of single specimens the most conspicuous is the *Bois de St. Lucie* of the French *Prunus Mahaleb* and its varieties. One of these, named *chrysocarpa*, is a magnificent tree about 20 feet high, and with a spread of branches nearly as much, the latter being slender and drooping gracefully nearly to the ground. The flowers are small, white, and fragrant, but they are borne in such profusion that the tree appears to be literally a mass of blossom. Another variety named *pendula* is represented by a large graceful tree similar to that just noted, but rather looser in its habit. This is much more ornamental in a smaller state; grown as a standard on a stem about 5 or 6 feet high, it forms a beautiful head of drooping branches, and is well suited for the margin of a lawn.

In the avenue between the Palm house and the temperate house are two specimens of *Prunus avium flore-pleno*, that for symmetry and beauty would be difficult to equal. They are each about 15 feet high, forming fine conical heads, the branches thickly clustered with large, pure white double flowers, rendering the trees remarkable at a long distance. Near the Richmond gate is large circular bed some 20 feet in diameter, planted with the dwarf and slender growing *P. japonica* (*P. sinensis*), which illustrates the advantages of grouping or massing when applied to suitable plants. These are, like small shrubs, 3 to 5 feet high, with pale green leaves, and abundant double pure white flowers borne along the slender, graceful branches. This is attractive as a pot plant, but is far more useful and ornamental massed as it is at Kew, and it is one of the hardiest of the introduced forms of *Prunus*.

There is much more of interest to be seen in the Royal Gardens than can be now set forth; in fact a special number of "our Journal" would be required to do justice to the theme, therefore these remarks must be concluded, or the Editor will think I am seeking to fill an undue proportion of his valuable space.—R. LEWIS CASTLE.

BULB FARMING IN IRELAND.

THE TREATY OF AMIENS STREET.

"WOULD I run down to Rush and see the Tulips, as Mr. B — of D —, and Mr. B —, of C —, were going on such a day, by such a train, from the Amiens Street Station of the G.N.R.?" "I would," and saw what has not been inaptly called "Holland in Ireland." One B was on the platform when the writer arrived; the other buzzed in merrily after promptly settling the question of carriage by flitting behind the barrier and emerging with third-class tickets. "No fourth." That nipped any budding argument respecting dignity. Our host rushed in a few ticks before time, counted us, and rushed off with some daring proposition to the powers that be anent stopping the express, of which more anon. "Take your seats" — we took 'em, pondering on what shall it profit a man who tenders sixpence for a penny paper to a grinning gossoon devoid of change.

EN ROUTE.

On the right is a fine bit of seascape as we rush northwards. Unfortunately, the one crushed in the opposite corner, to whom it is a new country, can catch little more than a peep of the passing picture as it unfolds and disappears. However, the merry B., bubbling over with anecdotes, which begin with ladies and smoking carriages and end with horticultural adventures in Italy, locates things in the intervals. By the peninsula of Howth, on by the foreshore, Lambay Island looms up in the distance, and finally two estuaries of the sea are crossed by embankment and trestle bridges, under which the ebbing tide is washing seawards. Rush at last, and a brief inspection of the stationmaster's Flora. *Ribes speciosum*, trained on the station wall, is in full flower, and very pretty are its simple red blossoms. His garden rises up the bank, and has a mild gracefulness in the disposition of many clumps of *Scilla nutans alba*. It is a railway garden accident, however, for a short interview with the Great Northern deputy discloses the fact that he regards gardening as a troublesome sort of business, and we depart to mind our own.

RUSH, AND THE RUSHIANS.

Imagination has proved a vain thing, the little hamlet of Rush and its people being quite unlike any preconceived notions respecting

them. The place has long been noted for early Potatoes, and for little else in modern times that I am aware of; now the bulb industry has appeared on the scene, and having passed the experimental stage is likely to remain. Sand—sand everywhere, and not a bit of soil—barring banks thrown up some 4 feet high, apparently built of turves brought from a distance, as wind-guards to the cultivated plots. Potatoes are grown on flat beds about 6 feet wide, with narrow alleys between, and very sparse and pale coloured is the foliage of what appeared to be Puritans. Lady Rushians are kneeling in the alleys busily engaged in stirring the sand with Dutch hoes quite innocent of handles. Quiet, thoughtful looking people they are, and, I understand, possessed of a strongly marked individuality of character. The naturalist B. deduces that as we are on historic ground (sand, I mean), Danish blood—very much diluted, of course—probably accounts for the feature. One trait of character is particularly pleasing—viz., not only do they refrain from coveting their neighbour's goods, his Tulips, or his Daffodils, or anything that is his, but woe betide the stranger within the district who dares to meddle with property practically unprotected. No notice boards, no spring guns, man-traps, or even a policeman are seen, and the moral salubrity of Rush is unquestionable.

DAFFODILS AND HYACINTHS.

The first plot, of some 2 or more acres in extent, is chiefly devoted to Daffodils, practically over, although a few late blooms nod in the breeze. Judging by the foliage they are happy, and the critics express themselves satisfied. I alone am surprised that they should flourish in pure sand; at which a young bulb-farmer, Mr. Robertson's manager, drops on his knees, and thrusting his hands into the loose sand, hoists up an Emperor bodily, to show his offsets and clean fleshy roots. "Ah! well, seeing is believing; but it's dreadfully dry." "No; things are not what they seem; you will get water at a foot in depth anywhere," says the manager, as he reinstates the evicted root. Here a concrete building is in course of erection for drying the bulbs, and an open shed near at hand is packed with shallow trays ready to receive them. Through a gap another field is entered, which seems to consist mainly of the great trumpet types. Hyacinths have merely to be mentioned. The foliage is luxuriant, and the naked flower stems show where the blooms have been stripped off for the benefit of the bulbs.

TULIP TALK.

The Tulips of May are in all their glory as we flit from division to division, and the busy B.'s improve the shining hour by prying into their cups; the scientific one settling vexed questions of nomenclature, and flies home, later on, with a bundle of blooms under his wing. No attempt was made to compile a list of those seen in bloom to-day. Early Dutch Tulips were, of course, over, but the names of such varieties most striking to a novice were jotted down. Golden Crown, a bronzy yellow, large bloom and dwarf habit, is very showy; Bouton d'Or, a pleasing yellow of tiller form. Masses of the delicate tinted Picotee are charming; this is a very refined flower; and fulgens is a fiery fellow besides which even the gorgeous Gesneriana pales. Both the type and the major varieties of the latter are seen, as well as lutea, its yellow form. Very attractive are macrospila, dwarf crimson; Oliver Goldsmith, rosy crimson; Medusa, bronzy red; and narbonense alba. Viridiflora præcox is, as the name implies, a decided green, but of elegant shape and vigorous constitution. Two primrose-yellow varieties stand out pre-eminent; the one is vitelina, the palest of the two, the other, jaune pure, a truly noble flower. Fairy Queen belies its name, being a dull smoked purple.

Dark Tulips are adequately represented by Alphonse Daudet, Herschell, and The Sultan; in the order named they are expressed by dark, darker, and darkest. The Sultan which, by-the-by, is not nearly of such fine form as its rivals, appears to be well on the road to that desideratum (?) a black Tulip. Laurentia is a bright satiny rose, and the gay Parrot Tulips are well to the front in perfecta, lutea, Mark Graf, and Admiral Constantinople. Miniature gems of the tribe are found in Batalini with grassy foliage, and others yet to bloom at the time of our trip. T. Kolpakowskyana, orange-scarlet, is a name to conjure with in pronunciation, and should fittingly close our brief list. For health, vigour, and cleanliness the Rush Tulips are remarkable, the foliage in some instances being for Tulips of gigantic dimensions; but the secret, if there is one, is locked in Nature's breast. "What manure do you use?" is a pertinent query with such results. The answer is, "Seaweed is the only manure used in this neighbourhood."

AU REVOIR.

The Great Northern express is to pick us up at Rush Station if—we're there. Our host is equal to all emergencies; here's a car. "Can you do it?" The driver looks at his load, and, apparently, defers answering till the station is reached. Too gallant a start, I fear! Poor Rosinante's mind seems spent on a spirited spurt, so we amble along as best we may, limp and deflated. That white flower studying the banks is Cerastium arvense, as good in its way as Arenaria

montana. Here we are at the station, whose master looks quite relieved at having something to show when the express, not yet in sight, stops. "Here she comes; be ready; she won't stop a minute." She didn't. We trained at the rate of one per second, to detrain at Malahide, ere which is reached the tree-embowered ancient castle of Lord Talbot de Malahide is pointed out. La Mucha, Mr. Robertson's residence, is distant a few minutes' walk, whither we repair to find a table adorned with Tulips, and more also, and return like giants refreshed to board another train for Dublin. Amiens Street again, electric tram passing. B.'s won't walk the short distance to Nelson's Pillar, where we part. *Au revoir*, as one flies off to the green plains of Kildare, the other, with a bundle of blooms, to an horticultural council meeting.—K., Dublin.

NIGHT TEMPERATURES FOR VINES.

How varied are the conditions under which Vines—and good Grapes—are grown. Some of the best examples of Grapes which find their way to the markets are grown under conditions diametrically opposed to the cut-and-dried formula often advanced as the best method to pursue. In pruning, stopping, manuring, and watering, some good growers seem to delight in defying recognised principles, and yet they succeed, sometimes to a remarkable degree.

It is simply a matter of manufacturing Grapes by the aid of "brains." Careful observation will continually teach us how to coerce a Vine into giving us a bountiful harvest, under conditions by no means natural. In other instances, a departure from the beaten track often insures more natural conditions than obtain under methods universally practised. This seems to me to be the ease in regard to the night temperatures given to Vines during the growing and fruiting periods. In Vine-growing countries the nights are cold by comparison with the tropical heat of the days, and I am convinced that many growers might, with advantage, give their Vines less fire heat at night than they do, and yet secure as rapid and satisfactory progress by admitting less air during the day till the Grapes are nearly ripe. If air is given in sufficient quantities, and in such a way as to prevent "scald" in the berries or "scorch" in the leaves, the treatment is suitable, except in cases when it is desirable to retard the Vines as much as possible. Much fuel is uselessly consumed in keeping up high night temperatures, instead of regulating the degrees of heat by the outside conditions.

I do not pay nearly so much regard to thermometer readings as I used to think necessary, but rely to a great extent upon placing the hand on the hot-water pipes; during cold nights I aim at having them hot, and vary the degree of heat in them according to the state of the weather. Some might advance—in condemnation of this practice—the fact that vineries vary considerably in the proportionate amount of piping they contain, but it is quite easy to get accustomed to the capabilities of any house in this respect, and the experienced man can readily detect on entering the house if the temperature is or is not suitable for the Vines.

Younger men, who perhaps need the thermometer to guide them, should be allowed considerable latitude in the matter of night temperatures. It is far better to allow the thermometer to fall 5° during cold nights than to overheat the pipes to maintain a given degree of heat. Let it, however, be clearly understood that I make a distinction between the above practices and that of allowing the hot-water pipes to become quite cool on cold nights, for it is such mistakes which cause damage to crops. In a nutshell, the matter stands thus, Do not be too particular in regard to temperature, as long as the hot-water pipes are well heated in cold weather, and only moderately during warm nights.

Thermometers are useful instruments, which we could not well do without, but they are only partial guides to the requirements of plants, fruit trees, or Vines. In Nature temperatures fluctuate greatly, and it is with my early forced Vines that thermometers are most useful. We have a late Hamburgh house in which no thermometer is kept, yet the Grapes grown in it are as satisfactory as they well can be from a market point of view.

Now for a few words in regard to the night temperature under which Vines succeed. In an early Hamburgh house we succeeded in getting a splendid set, although the night temperature frequently fell below 55°. There are also two rods of Muscats in this house, and with exactly the same treatment the bunches have set as well as I have generally found them do in instances when a night temperature of from 70° to 75° has been maintained. I am being more than ever convinced that high night temperatures for Vines are a mistake. At the flowering period the vital points to observe are to maintain a buoyant atmosphere during the middle of the day, and not to unduly excite them by high temperatures at night.—H. D.

LEGAL RIGHTS AND OBLIGATIONS OF MARKET GARDENERS.

WILL you oblige by giving me information, through the medium of the *Journal of Horticulture*, on the following questions as to what is the law in regard to the tenant-rights of bona-fide market gardeners and their claims in respect of the following?—ENQUIRER. [As the whole subject is of considerable importance, we publish the questions, with replies, but draw particular attention to the saving clause at the end.]

Q. 1, Can the Acts compel a landlord or incoming tenant (when leaving a place in October) to take at valuation such things as Daffodils, Narcissus, or other bulbs? Do they come under the same rule as other root crops?

[A. 1, There is no mention of bulbs in the Market Gardeners' Compensation Act or in the Agricultural Holdings Act, and it is doubtful whether any claim for them could be substantiated. In the first case tried in Scotland under the Market Gardeners' Act (Taylor v. the Governors of George Heriot's Trust), decided by arbitration, a claim for Narcissus bulbs was made and withdrawn, and, the referee said, "very properly" withdrawn. It would be much safer to raise and sell the bulbs, unless the landlord will give a written agreement to pay for them by valuation.]

Q. 2, What is the law in respect to such things as Raspberries, Currants, Gooseberries, Strawberries, Rhubarb, and herbaceous plants generally? If the tenant plant such things in the soil, how long is it necessary for them to be planted before the time expires in which they can be moved by the tenant?

[A. 2, In the first place, it must be stated that claims for compensation under the Market Gardeners' Act are valid under only one or the other of two conditions: (a) If under a tenancy current at the commencement of the Act (1st of January, 1896) the holding was in use as a market garden with the knowledge of the landlord, and the improvements were carried out by the tenant without his having received, previous to their execution, a written dissent from the landlord; or (b) if the holding has been taken since the commencement of the Act, and it has been agreed in writing that it should be let or treated as a market garden. Under either of these conditions the landlord can be compelled to pay the out-going tenant for all fruit trees or fruit bushes permanently set out by him, for all Strawberry plants set out, and for the planting of Asparagus and other vegetable crops, no doubt including Rhubarb. All fruit trees and bushes not permanently set out can be removed by the tenant; but if he does not remove them before the termination of his tenancy he will not be entitled to any compensation for them. The moment after they have been permanently set out compensation is claimable for them if the tenant quit his holding, and, as we understand the law, he cannot afterwards remove them without the landlord's consent. But if he is a nurseryman who habitually sells trees, it might be assumed that the trees were not necessarily intended to remain permanently.]

Q. 3, Can a tenant plant an open space with such things as are mentioned in question No. 2, or permanent fruit trees, and claim for them on leaving; or is he compelled to remove them in case the landlord or incoming tenant declines to take them?

[A. 3, This question is answered in No. 2. The landlord is bound to pay for all fruit trees, bushes, &c., permanently set out, no matter whether the incoming tenant agrees to take them or not.]

Q. 4, When a tenant enters upon a place and pays no inventory, and there are already planted 1000 Rasps, Gooseberries, or other things of a similar kind, and the same tenant remains ten or twenty years, and those things are either worn out by time or neglect, is he bound to replace them, or, if he has planted others to replace them, can he claim for those so planted when leaving?

[A. 4, A tenant is liable to pay a landlord for dilapidations, due to his neglect or mismanagement; but we do not think he would be bound to replace trees or bushes worn out by age, unless he agreed to do so in his contract. On the other hand, a claim on his part would presumably arise if he did away with a worn-out plantation and planted a new one.]

Q. 5, In the event of a place having been resold in the middle of a tenant's tenancy, and there has been no agreement between the tenant and the new owner in respect of inventory, how would the matter stand on the tenant leaving?

[A. 5, The new owner would take over the liabilities of the old one in relation to the tenant.]

N.B.—It must be understood that these opinions simply express our interpretation of the Market Gardeners' Act, that we do not give them as the judgment of a legal expert, and that we cannot assume responsibility for their accuracy. The Act can be bought for a halfpenny, or a penny by post from Messrs. Eyre & Spottiswoode, East Harding Street, E.C.; and our correspondent and readers may form their own opinions as to the correctness of our interpretation of it, or consult a legal adviser.

LINARIA MACEDONICA.

SUCH is the name of the specimen forwarded by "W. Raby," and he may also like to know that many species of *Linarias*, or Toad-flax as they are often called, make charming plants when grown in pots for a cool house. The genus being a large one, including both hardy herbaceous and annual kinds, it is rather difficult to make a selection; but *L. macedonica* (fig. 93) is highly ornamental, and might be used with good effect. It commences to bloom in early spring, and continues for a long time. Like most of the *Linarias* it is of easy culture, requiring only some rich soil and a light position in a cool house or frame. It freely reproduces itself from seeds, growing about 18 inches high, and flowers profusely in a short time. The flowers are of a bright orange colour and very attractive.

FLATLAND.

A MORE curious and extraordinary part than the Low Country it has rarely been my lot to experience. Returning lately from a visit to the Balkan Provinces and Turkey, and fresh from the mountain regions along the Elbe and the picturesque châteaux perched high on seemingly impossible crags and such like points of vantage, my surprise and interest was extreme on arriving at Amsterdam, and with that place as my centre, inspecting the country around in all its peculiarities of dykes, dams, canals, windmills, and luxuriant meadows. Such an absolute and perfect flat I have seen nowhere else in the nature of cultivated land (excepting the partially cultivated great plains of central Europe), the nearest approach to it being its first cousin the Lincolnshire fen and marsh land.

All reclaimed from the sea and protected by high banks there is not the vestige of a hill or mound of any description, the only elevated parts being where the ground has been raised to bridge over a dyke. It speaks volumes for the indomitable energy of the people to have conceived and carried through such a monstrous undertaking. Talk of the Emerald Isle, I doubt, indeed, if the green of those Dutch meads can be anywhere equalled; such luxuriance, they looked as if fattening bullocks were the veriest pastime.

I travelled across a good stretch of this remarkable country, out to the Zuyder Zee, where I visited the island of Marken, a curious spot inhabited by natives, who have preserved their pristine customs and dress against the blandishments and the march of civilisation and progress.

I reached the island in a small sailing lugger, almost flatbottomed, and drawing an incredibly small amount of water, the depth of the Zee varying from 2½ to 4 feet. It reminded me of nothing so much as punting over Port Meadow in time of flood during my undergraduate days at Oxford.

The open flower markets all alongside one of the principal quays in Amsterdam, and leading to the centre and focus of the town called "the Dam," is a charming sight. Not only the far-famed bulbs of every description, but beautiful flowering shrubs and plants of all kinds in their damp peaty mould greet the eye. Rhododendrons, Azaleas, Pansies, Anemones of every shade of colour attracted one. Seeds in 5 cent. packets, too, of all sorts, entice the sous from the recesses of your pockets. I was tempted to try a dozen Strawberry plants, they looked so fresh and healthy, and trust they may render a good account of themselves in a few weeks' time.

The farmhouses of these low lands of Holland look exactly like red brick pyramids, such being their shape as appearing to within a short distance. Except the tiny villages there is nothing else to relieve the eye (there being no trees), but the windmills, of which there are very large numbers, used principally for pumping away into the main dykes the surplus water. No reference to a visit to Holland in spring would be complete without a word on the bulbs. Of course I went out to Haarlem to have a look at them. I visited several gardens. All afforded the same gorgeous display. Great patches of superb pink, mauve, yellow, and white Hyacinths varied their beauties with richly perfumed plots of white and orange Narcissus, while the Tulips, which were just in their prime, made a very bold bid for first favourites. I noticed the Pansies as being very much in evidence, and making a very beautiful though modest display as compared with the stately beauties before mentioned.

It was altogether a most enjoyable and successful jaunt to the bulbs, and I returned to Amsterdam much pleased with myself and things in general. In a short time I terminated my stay in this most interesting and unusual country, after a last and brief visit to one of the Hollanders' little bathing places, Zandvoort—a curious place among the sand dunes, and only regretted the season not being sufficiently advanced for a bathe in the good old Dutch briny.—J. A. CARNEGIE-CHEALES.

LONDON GARDENS OVER FIFTY YEARS.

No. 8.

WHEN our good Queen takes one of her drives about West London, and such are now very occasional, she cannot but be impressed by the changes which have passed over Brompton and South Kensington, should she happen to take that direction. What a different suburb it is to what her Majesty knew it fifty or sixty years ago. I do not think we can point to any other locality near London which has been so revolutionised in a half century. South Kensington! You will not find the name on maps of 1849 or 50, but there is Old and New Brompton, and "Little Chelsea," which seems singular, a sort of link between Chelsea and Brompton. Now, the name of Brompton is going out of use; it is of some antiquity, traceable to the fifteenth century, at least here was possibly the town or manor of someone called Brom or Broom, nobody can tell.

The air of Brompton was reputed to be so pleasant and healthful that people said the place was an English Montpelier; streets were multiplying thereabout when I first knew it, yet still there remained some of the charming villas, with their shrubberies and old style gardens. Brompton at that time was the favourite abode of actors, artists, and singers, amongst other celebrities. But, above all things, we remember Old Brompton by its nurseries and market gardens, extending up to and around Earl's Court or West Brompton, a few orchards thereabout, too, more towards Fulham and Hammersmith. The locality was eminently suitable for gardening purposes, soil good, sheltered from the colder winds, and at a convenient distance from the chief London markets. Large profits were made by growers during years of average success.

To the present-day Londoner, or the country visitor, South Kensington and its neighbourhood is chiefly known as the temporary abiding place of big sensational exhibitions, and the permanent home of national museums, art, science, or other institutes; it was just the locality likely to be taken advantage of when a start had been made by the South Kensington Museum. Environing these are many handsome residences, some of them occupied by zealous patrons of horticulture, and it is satisfactory to find that Brompton, once renowned for its flowers and fruit, has still its open spaces secured against the builder's invasion, some of which indicate improvement, for where not so long ago Cabbages or Potatoes grew are now to be seen the choice flowers of the season.

The influence of the temporary occupancy of gardens by the Royal Horticultural Society is still observable in this suburb. But it will take years to replace the fine old trees which had to be cut down, especially Acacias, Limes, Planes, and Chestnuts. Magnolias of two or three species flourished about Old Brompton, and the place was famous for its Poplars; there were good examples of the grey variety, the Lombardy, and the Tacamahac, the last few years more Poplars have been planted along several roads. The Birch, again, does well in London, and is a graceful and pleasing tree, if not very shady, but the trouble is to protect it while young.

The early fame of Brompton in horticulture rested mainly on Brompton Park—first of all a deer park, no doubt attached to an ancient mansion, which became a nursery towards the end of the seventeenth century. Commenced by four gardeners, it owed to London and Wise its world-wide repute, who formed the firm in the reign of Anne, and had an extent of 100 acres to work upon. On the Kensington side they formed an open-air winter garden, then quite a novelty, and did a large business, chiefly in shrubs or trees, the stock being so extensive that Bowack estimated it to be worth many thousands of pounds in 1707. Various changes ensued, but we note the fact that the last occupiers were Gray, Adams, and Hogg. During 1850 the remnant of the nursery was offered for building purposes; it was then reduced to about a fourth of the original dimensions—part had been built upon, and smaller nurseries had been formed out of another part. A portion of the old wall, half a mile long, which used to be covered with Vines, remained till the above date. Between Brompton Road and Kensington Gore a green narrow lane skirted the east side of Brompton Park Nursery; a remnant of this, near the church, was open in my boyhood, where I went seeking wild flowers! Dr. Hogg once remarked to me how he had found from the accounts of Brompton Park nursery that before railway times, though the locality was not close to the Thames, it was employed for the conveyance of goods to market, also for the importation of manure from a distance. The front of this nursery was in the Kensington Road.

Another historic nursery that disappeared about the same date was the Kensington Nursery, started by Furber, and subsequently taken over by the firm of Malcolm & Co., for many years connected with Stockwell, Surrey. Hale House, Cromwell Lane, on the south of the park, was the nursery of the Pouparts (quantities of the Muscadine Grape were produced here), and adjacent to it was Mr. Kirk's, also on the ground of the old park. He was in repute as a producer of new varieties of fruit trees. Faulkner tells us that he could show at one

time more than a hundred sorts of App'es—some not worth anything, I daresay.

Adjacent to, if not within the borders of the park, Gibbs of Old Brompton had an establishment for flowers and shrubs, but he did most business in supplying seeds of grasses and cereals raised in his experimental garden. All these passed away, but the formation of the South Kensington Gardens, under the auspices of the Royal Horticultural Society, seemed to recall the old traditions of Brompton Park at its best, while exhibiting the latest improvements and novelties in horticulture. Before that enterprise was entered upon, however, the Society had a much smaller garden at Kensington, near Holland

FIG. 93.—LINARIA MACEDONICA.

Park, the exact position of which has been disputed; I believe it must have been about the spot where is now a railway line. This carries us back to 1818; a few years after that it was relinquished, also the temporary garden at Ealing, and the Chiswick ground was taken. Encouraged by success, the Society looked again towards the Court suburb, and, with the hearty approval of the Prince Consort, took possession of 22 acres at South Kensington in 1860, I think. The plans, drawn up by Captain Fowke, Messrs. Nesfield and Smirke, embodied his ideas or suggestions, and they had his corrections finally before they were executed.

There were already many trees and shrubs on the ground, giving a considerable advantage as a basis to start upon, though they limited the prospect in some directions, but did not interfere with the working out of the design, which was to present a garden in the Italian style, combining the effects of Nature and Art. Of course a certain class of critics said the garden was too artificial or elaborate, a profusion of "fountains, canals, cascades, terraces, balustrades, alcoves, and parapets, with vases, statues, and numerous other embellishments," still the variety was agreeable. One of the features of this garden

that pleased most visitors, was the admirable way in which climbing plants were distributed over the walls, alcoves, and arcades, softening the outlines, but not overwhelming them with greenery. The bedding in these gardens served as a model, which was extensively copied elsewhere, especially in the arrangement of contrasts of colour and the avoidance of too free a display of brilliant tints.

It was here, too, the fashion began of making up beds in which foliage, not flowers, are the chief characteristic. Long undulating borders along some of the walls displayed very attractive colouring, and at the top of the central walk a grand circular bed, surrounded by other circles and triangles, which perhaps would not suit the present taste, but served to show off some favourite flowers. Unfortunately the South Kensington Garden is not associated with one of the brighter periods in the history of the Society. From 1883 to 1886 a large portion of the ground was occupied by exhibitions, closing with the important India and Colonial one; and, finally, the northern part was utilised for the Imperial Institute.

Brompton, indeed, as it extended to the west, was the quarter, in the earlier years of the century, of a giant amongst our suburban gardeners. This was the celebrated Gunter, who had more than sixty acres of land under cultivation between Brompton and Kensington. For awhile he reigned at Earl's Court over nurseries and market gardens. His predecessor, Hutchins, of an old Chelsea family, had also extensive grounds between Chelsea and Kensington. But by 1850 a change had commenced, the Boitons and other terraces were building adjacent to Old Brompton Road. Names once familiar and suggestive disappeared; vainly we might seek for "Salad Lane" or "Hogmere Road," but on the south side, some years after, there yet remained Honey Lane and Walnut Tree Walk, overlooking fields or gardens near Brompton Cemetery. Gunter is said to have been one of the first to employ steam for heating forcing-houses. It was after 1863 that the remnant of the gardens between Gloucester Road and Earl's Court vanished, to be succeeded by new streets.

Brompton Heath seems a comical name now, yet it was a heath, or sort of common, part of the ridge of waste land which extended, in the olden time, from Pinlipo to the border of Kensington. Beyond it was Brompton Vale, across which wandered a little streamlet which somehow reached the Thames. Several market gardeners cultivated portions of this heath fifty or sixty years ago; it was a good position. I remember part of it was open till 1865 or 1866. Vegetables and fruit, rather than flowers, were the main object of Brompton gardeners formerly, as being then more remunerative.—J. R. S. C.

CLANDON PARK.

MR. H. BLAKE, Lord Onslow's gardener, is having a small trial of some of the more recently introduced Brobdignagian Onions, obtained in packets direct from the vendors. Some of them gave plenty of plants relatively, but one of rather high class pretensions gave but eighteen plants from a 2s. 6d. packet. All the seeds were sown under glass. Presumably the majority grew the wrong way. However, grown well, yet not to produce giant bulbs, it is hoped that some evidence may be obtained as to distinctness or otherwise. For several years he has been troubled to induce Raspberries to ripen canes—these usually dying in the winter—and a new plantation of Superlative, from Messrs. Bunyard at Maidstone, was made on a fresh piece of ground. These have done splendidly, and this year present every appearance of giving a fine crop. When the old site of the Raspberry plot was trenched it was found 2 feet down to be a solid bed of clay, on which water stood. That clay has now been removed, and the ground is carrying a fine breadth of root crops.

Most valuable in one quarter is a fine breadth of Sutton's Late Queen Broccoli that will furnish heads up to the end of the month. This is a most useful vegetable. Elsewhere was an admirable breadth of Flower of Spring Cabbage, just getting fit to cut from. Universally Cabbages are late this season. This variety is here particularly good, and not a plant has bolted. It is evidently a first-class spring variety. I should have mentioned that in sowing seed of Late Queen Broccoli, the operation does not take place until the end of May.

Tomatoes are being grown in a span house. I noticed that the roots are limited strictly to long stout wood troughs, 16 inches wide, and 9 inches deep within. The plants stand 15 inches apart in these troughs. How well they look, so stout and sturdy, and full of promise of a fine crop. The variety generally is Perfection. A great crop is obtained from this house on plants so grown yearly. There were at one end two plants only of the variety which Mr. Blake had in fruit in a pot so wonderfully last November, and these planted at the same time had set fruits and were much ahead of the others in bloom production. Melons do well, the chief variety being Hero of Lockinge.

Having formerly been greatly troubled by woodlice, earwigs, and mice, Mr. Blake had some cylinders made of tin 8 inches long and 4 broad. Halfway along these cylinders was fixed a trough, 2 inches wide and 1½ inch deep, to hold water. When the young Melon plants are put out on to the soil bed, these metal cylinders are placed over them, singly, and pressed down into the soil, so that the bottoms of the circular troughs touch the soil. These are then half filled with water. The result is that never since the adoption of their use has there been trouble

from insects, or mice, or canker, or similar pests, so that the making of these things has been well repaid.

A fine collection of Marchioness of Exeter, White Lady, and other double Chinese Primroses in a frame, were just in the process of rooting from side growths. The surface soil is dressed with three parts of sand to one part moss. This is done in April, and in two months, without further trouble, all the side growths have rooted well into it, and fine plants are obtained.—A. D.

GARDENING IN TRINIDAD.

THAT gardening in this "Pearl of the Antilles" differs much from the gardening usually written about in the *Journal of Horticulture* will be made apparent by giving a few meteorological statistics. The mean annual rainfall for the ten years from 1887 to 1897 was 71.10 inches, and the mean annual temperature for the same period was 78° F. The mean maximum was 87°, and the mean minimum 69°, giving a range of only 18°. In some parts of the island, at Diego Martin, in November of last year, we had over 22 inches of rain in one month, and at Moruga Road Station last year the total rainfall was 128.24 inches.

It is during the dry season—from January to May inclusive, that gardening is simplest and safest, because then there are no heavy rains which in the wet season damage nearly everything, but especially those plants which are natives of less moist climates. Amongst these are several vegetables and flowering plants which are common in the gardens of the British Isles. We grow Tomatoes and Cucumbers with fair success. Melons have hitherto been unsuccessful, but we intend trying again. Cabbages are seldom worth growing unless planted about the end of the wet season, when the plants get established before the drought commences, and they then produce good heads in the dry weather with occasional watering, while they are less apt to rot, which they do readily in the wet season. Kohl Rabi, Kidney Beans, and Lettuce are very successful with us, likewise Radishes and Beetroot. Peas and Potatoes are scarcely worth growing, neither is Cauliflower. We grow several tropical or sub-tropical vegetables, such as the "Garden Egg," fruit of *Solanum melongena*, the Bitter and Sweet Cassava, Yams, the tubers of various species of *Dioscorea*, some of which, in my opinion, are better than good English Potatoes. We have hitherto been unsuccessful with Vines, but have now some seedlings growing under glass, of which we hope to have a successful yield.

Tropical fruits are abundant, such as Mangos, Sapodillas, Cusheaws, Star and Golden Apples; and Oranges, Lemons, and Limes are plentiful, so are Bananas, and they, like several of the other fruits mentioned, are far superior in flavour and lusciousness, when left to ripen on the tree, to those sold in London or elsewhere, being ripened a considerable time after being taken from the plant.

Amongst bedding plants there are several of those used in England for the purpose which do well here in the dry season. *Tagetes patula* and *T. signata*, the French and Mexican Marigolds, do fairly well; so also do *Zinnias*, *Cannas*, and *Gladioli*. We have some charming beds of *Coleus*, *Crotons* (*Codiaeum*), *Russelia juncea*, with plants of *Asparagus plumosus* here and there, and *Alternanthera versicolor* or *Pilea muscosa* for an edging.

The front gardens of the villas in the town suburbs are gay with *Crotons*, *Dracenas*, *Acalyphas*, and *Palms* as foliage plants. One of the commonest flowering shrubs is *Hibiscus Cameroni*, with large bright crimson flowers. There is also *H. schizopetalus* and other species which I do not know. *Plumbago capensis* is flowering well now, and is sometimes seen in the form of a hedge. *Aralia Guilfoylei* is also a common hedge plant. These are decorative hedges. For ordinary field hedges a succulent species of *Euphorbia*, probably *neriifolia*, is largely used, and with its prickles and poisonous juice it forms an almost impenetrable barrier for man or beast.

Roses do fairly well in some places, where they are surely protected from the ravages of the "parasol" ant, one of our most destructive creatures. If we notice as we walk along some morning that one of our Rose bushes is stripped of half its leaves, we shall find on examining the ground that an army of ants is busy carrying the leaves off shoulder high, and as they work single file, and each one's booty is carried like a miniature parasol, the procession is about as interesting and amusing as the result is destructive and deplorable. Other kinds of ants devour seeds, and the mole-cricket has the annoying habit of nibbling through the stem of young plants just below the leaves.

Before finishing this brief sketch I would like to note a few climbers which are grown here. *Thunbergia grandiflora* flowers well, and is often seen. Various species of *Allamanda* and *Clerodendron*, *Ipomoea digitata*, and *I. quamoclit* are met with occasionally. We have a fine form of *Bougainvillea spectabilis*. It flowers with great profusion, the bracts being of a bright brick red. A plant of this has climbed a tree about 80 feet high, and occupies a large part of its crown. As the tree is deciduous it forms quite a feature in the landscape, the bright red patch contrasting well with the surrounding greenery. Such are a few observations made by a gardener lately arrived in this lovely and fertile island.—X. L. C. R.

RECENT WEATHER IN LONDON.—We have not had weather that would meet with the general appreciation of holiday makers during the past few days. On Bank Holiday rain fell in torrents during the morning and evening, though there was a gleam of sunshine in the afternoon. Tuesday was much the same, but the showers were not so heavy. On Wednesday morning it was dull and colder.

WEATHER IN THE NORTH.—The past week has been marked by bitterly cold easterly winds, excessive rainfall, and an almost total want of sunshine. Thursday and Saturday were days of continuous and heavy rain till well on in the afternoon. Sunday and Monday were fair, but very dull and unseasonably cold, the N.E. wind making it more like March than May.—B. D., *S. Perthshire*.

ROYAL HORTICULTURAL SOCIETY.—SCIENTIFIC COMMITTEE. Present: Dr. M. T. Masters (in the chair), Dr. Müller, Rev. W. Wilks, Mr. E. F. Im Thurn, and Rev. G. Henslow, Hon. Sec. Diseased *Hemerocallis*, &c.—A leaf was received bearing decayed spots, apparently due to fungoid growth. This, together with a Peach diseased by a form of mildew, and Apple twigs with knots, were forwarded to Dr. W. G. Smith for examination. *Podisoma* on Savin.—Dr. Masters exhibited specimens of this fungus, which gives rise to *Ræstelia cancellata* on Pear trees. *Leclidium grossulariae*.—He also brought specimens of the "Gooseberry cluster cups." It occurs on leaves and fruit of the Gooseberry and Currant. In some seasons it is of frequent occurrence. Morel.—Dr. Masters also showed a small Morel, found—as is somewhat rarely the case—growing singly. He recorded the fact that after two Poplars had been blown down in Mr. Masters' garden at Canterbury in 1837, Morels grew every other year round the stumps. Mr. Im Thurn observed that the Morel was a common fungus on the Wiltshire moors among Beeches.

HORTICULTURAL CLUB.—The usual monthly dinner and conversation took place on Tuesday last at the rooms of the Club, Hotel Windsor; there was a good attendance both of members and their friends. The chair was occupied by the Rev. W. Wilks in the unavoidable absence of Sir J. D. T. Llewelyn, Bart. There were present besides Dr. Maxwell T. Masters, Sir John Farley; Messrs. J. H. Tritton, C. E. Shea, R. Gofton Salmond, George Monro, Peter Kay, H. A. A. D'Ombraim, H. Somers Rivers, C. Mason, Philip Crowley, and others. A very interesting paper was read by Mr. Gofton Salmond on the preserving of vegetables by evaporation, and a number of specimens of vegetables so prepared were exhibited. An interesting discussion followed, in which most of those present took part, and the feeling among all present was that the process would be invaluable for the army and navy, and for all expeditions where the obtaining of fresh vegetables would be a matter of great difficulty. A cordial vote of thanks was proposed and carried to Mr. Salmond for his excellent paper, which appears on page 430.

ROYAL METEOROLOGICAL SOCIETY.—Owing to the public improvements in the neighbourhood of Parliament Street, the Royal Meteorological Society has been obliged to vacate its offices in Great George Street and find accommodation elsewhere. The Council ultimately took rooms at Prince's Mansions, 79, Victoria Street, which have been fitted up to meet the requirements of the Society. On Tuesday evening, the 16th inst., the President, Mr. F. C. Bayard, LL.M., held an "at home" in these new rooms, which was largely attended by the Fellows, among whom were the following:—Mr. W. B. Bryan, Mr. Baldwin Latham, Professor J. K. Laughton, Admiral Maclear, Dr. H. R. Mill, Dr. R. A. Scott, F.R.S., Mr. G. J. Symons, F.R.S., Dr. C. Theodore Williams, Mr. E. Woods, and others. An interesting exhibition of instruments and photographs was arranged, and there were also several demonstrations by the optical lantern. At the monthly meeting of the Society, held on Wednesday afternoon in the above rooms, Mr. H. N. Dickson, F.R.S.E., read a paper, entitled "The Mean Temperature of the Surface Waters of the Sea round the British Isles, and its Relation to that of the Air." A paper by Major-General Schaw, C.B., on "Some Phenomena connected with the Vertical Circulation of the Atmosphere" was also read.

GARDENING APPOINTMENT.—Mr. R. W. Eastwood, for the last ten years foreman at Worsley Hall, Manchester, has been appointed head gardener at the County Asylum, Whittingham, Preston, Lancashire.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—A most successful meeting was held at Reading on Tuesday, May 16th, over 250 persons being present to discuss the desirability of forming a branch of this admirable institution at Reading. From the tone that prevailed it is hoped that the branch will be a very successful one.

ROYAL BOTANIC SOCIETY.—At the show on the 17th inst. the following medals were awarded: Silver-gilt medal to Messrs. J. Peed & Sons for Caladiums; large silver medals to Messrs. Laing & Sons, Forest Hill, for stove and greenhouse plants; W. Paul & Son, Waltham Cross, for group of Roses; Barr & Sons, for Tulips and other flowers; and Rivers and Sons, Sawbridgeworth, for Nectarines; silver medals to Messrs. R. & G. Cuthbert, Southgate, for new hardy Azaleas, and to Wm. Rumsey, Joynings Nurseries, Waltham Cross, for Roses; small silver medals to Messrs. C. Turner, Slough, for Carnations; Kelway and Sons, Langport, for tree Paeonies; L. H. Calcutt, for floral exhibit; and to W. H. Moss, for floral table decorations; large bronze medals to Messrs. J. Prewitt, Rayleigh, for table decorations; and A. Smith, for Roses and Pansies.

POTATO UP-TO-DATE.—That this remarkably fine and productive variety has disappointed some of its growers when cooked there can be no doubt. It has white granulated flesh, that cooks quickly, usually much quicker than is generally anticipated, and when regarded as done is much to pieces. The best corrective is found in pouring off the water from the saucepan just before the tubers soften, then finishing them gently in a dry condition. But no doubt this Potato would greatly benefit could it have infused into it some of the yellowness and greater consistency of flesh found in the Bruce or similar more solid fleshed varieties. Raisers should take a note of that, and endeavour to secure this desideratum. Up-to-Date furnishes not only grand crops but the tubers are handsome, and worthy a high place at exhibitions. Probably it is yet the heaviest cropper in cultivation.—D.

DEATH OF MR. JAMES KELWAY.—We observe with regret an announcement of the death of Mr. James Kelway, the founder of the well known firm of florists of Langport. The venerable head of this firm died at Huish Episcopi, Somerset, on the 17th inst., in his eighty-fourth year. The deceased gentleman was highly esteemed for his urbanity by all who knew him, and was one of the most trusted of men in the town, which he served so well in his public capacity in municipal offices, including that of Mayor, to which he was eventually and unanimously elected. Mr. Kelway was a kind hearted, clear headed, business man, upright and honourable in all his actions, and his genial presence will be greatly missed by all who had the pleasure of associating with him. He was not often seen at the London shows where, on so many occasions, the floral riches of Langport have been honoured. The exhibits of Gladioli, in nine cases out of ten, out-distanced those of all competitors, and scarcely less striking were the groups of Delphiniums, Paeonies, and Pyrethrums, so effectively displayed by his son, who has, no doubt, of late years, had the practical management of the flourishing business that is so well known in the horticultural world.

SPRAYING FRUIT TREES IN NOVA SCOTIA COMPARED WITH IN ENGLAND.—*Re* Mr. Jno. Miles' article in the last Journal I ought perhaps to have added that snow is on the ground most of April in Canada, and that Apple foliage and blossoms only open about the last week of May or the beginning of June, after which the growth of plants is very rapid. I am very sorry that any of my remarks should have been misunderstood by Mr. Miles, and that his trees should have had to consequently suffer. The potash solution, $\frac{1}{4}$ to 1 lb. caustic potash to 1 gallon of water, should only be sprayed whilst the tree is perfectly dormant, or used to paint the trunk during summer. For some chemical reason I imagine combined caustic potash and soda appears to have a more burning action than potash alone. The foliage in England will not stand quite as strong a solution of Paris green as in America. I think that Plum foliage is less tender than Apple here and the reverse over there, and that the foliage of young Apple trees is more tender than that of old trees, and of course young leaves are more tender than old. I hope on Thursday, May 24th, at three o'clock, weather permitting, to have a demonstration of work of the "Pomona" spray pump on my farm at Highlands, Swanley, Kent, spraying fruit trees with Paris green and Bordeaux mixture, and an Oat field with copper sulphate to destroy charlock. If any readers of the Journal will favour me by attending I shall be most pleased. Highlands is one mile from Swanley Junction and eighteen miles from London on L.C.D. Railway.—CECIL H. HOOPER.

The weather during the week has been very unsettled and dull, with a thunderstorm on the 16th. Rain fell on five days, the heaviest quantity being on the 14th, which was the greatest fall for any one day this year.

— **GENISTA HISPANICA.**—Though with all the characteristics of the Gorse tribe, to which it belongs, this is far more refined in appearance than the type. Its habit commends it for culture to those who love the cheerful golden blooms of the wildling, yet consider its nature too aggressive for planting in or about shrubberies, or such places where the Spanish variety would be welcomed.

— **EUPHORBIA MELLIFERA.**—Rather a striking plant now in bloom is *Euphorbia mellifera*. As seen recently in the College Gardens, Dublin, it is a shrubby plant well worth having, more, perhaps, from its shapely habit of growth and modest toned blossoms, than from any claims to garishness, which it does not possess. Farther inland it might not possibly prove to be hardy.—K.

— **PARSLEY-LEAVED BLACKBERRY.**—I was pleased with the appreciative note by Mr. Pearson anent this useful fruit which, as he points out, is far ahead of any of the American berries that have been introduced here from time to time. This is doubtless in part due to climatic conditions—not necessarily cold. But the Parsley-leaved Bramble is quite a different thing, and I was reminded of this recently when looking through a small garden at Ipswich where this plant is trained over an arch extending for 20 yards or so over a gravel walk. The owner takes a great quantity of delicious fruit from this annually.—C. H.

— **TOO MUCH RAIN.**—The cry, We are getting too much rain, comes from the trader, the cricketer, the lover of pleasure, and Whitsun holiday maker naturally. I do not think many gardeners will agree with the cry, or farmers either, except those who cultivate very clayey soil. It is not that we are getting a drop too much of moisture, for we know but too well how rapidly under the influence of warm sunshine moisture disappears. But what we want more is rather sunshine and warmth, as because of the lack of it vegetation is late, and moves slowly. But the rains should do the fruit trees great good. They badly needed cleansing, and the roots will benefit by the moisture. These showers should prove a long way more effective than insecticides in cleaning the young leafage, and at no cost. There is plenty of time yet for sunshine, and soon we may be wishing for some more of these refreshing showers.

— **SHIRLEY GARDENERS' ASSOCIATION.**—A monthly meeting of above Society was held at the Parish Room, Shirley, the 15th inst., there being a large attendance of the members presided over by Mr. B. Ladhams. Mr. A. Angell, Ph.D., F.S.I., public analyst for the county of Hants, gave a most interesting and useful lecture on "Sexuality in Plants," illustrated with lantern slides, for many of which the lecturer was indebted to the kindness of Messrs. Sutton & Sons of Reading. A discussion ensued, and several questions were put to the lecturer and answered satisfactorily. A vote of thanks was accorded to Mr. Angell, who, in responding, proposed a vote of thanks to the exhibitors who had brightened the room with a large display that evening. Amongst the exhibits were a group of New Holland flowering plants of special interest exhibited by Messrs. W. H. Rogers & Son, Limited, Red Lodge Nursery, and a group of miscellaneous plants, including five new *Spiræas*, which latter were accorded a first-class certificate; staged by Mr. B. Ladhams, Shirley. A plant of *Medinilla magnifica* was shown by Mr. W. Risbridger, and a very fine plant of *Acalypha hispida* (Sanderi) by Mr. E. J. Wilcox, both of which were awarded certificates.

— **IN A RENTED GARDEN.**—How often do we hear the remark, "What is the good of my doing any gardening here; I only rent this place?" That may be so, but while rented the place is the home of the occupant, and surely there is no good reason why the exterior and the surroundings of a home should not be made beautiful, just as much as is the interior. The inside walls are ornamented with pictures, why not the outside walls with plants, of which a host stands available? The cost of such a thing is trifling; a few hardy shrubs can be purchased for a few shillings, and the pleasure to be derived therefrom cannot be measured by the original cost.—("American Gardening.")

ABOUT MELONS.

THE earliest plants are often quite healthy when the first crop is cut, and by timely attention to encouraging laterals, successional fruits will set whilst the house is kept drier for the ripening. Such will produce excellent Melons in a short time, and though smaller than the first crop, they are frequently higher in quality. In other cases it may be advisable to shorten the old stem to a strong shoot near its base, removing as much of the old soil as can be picked from amongst the roots without injuring them, supplying rather strong lumpy loam pressed well down, and giving a good watering. A moist atmosphere being maintained, and the plants syringed in the morning and about 4 P.M., they will start freely, showing fruit in much less time than by planting afresh. If, however, the plants are affected with canker, or from carrying too heavy a first crop, deficiency of water, or attacks of insects, are much enfeebled, it is better to remove them. Thoroughly cleanse the house after removing the old soil and place fresh sweet compost in ridges or hillocks, planting strong plants when it has warmed through.

Early Melons are coming in and are of excellent flavour, through the days being bright, and the average of temperature considerable. Plants swelling their fruit require a good heat—a night temperature of 70°, though 65° or even 60° will do no harm when the nights are unusually cold and the days bright, 70° to 75° by day being artificially secured, admitting a little air above the latter, allowing an advance to 85° or 90°, closing at 80° to 85°, but so early as to raise the temperature to 90°, 95°, or 100°. Abundant moisture is needed in houses containing young growing plants, also feeding liberally those having their fruits swelling, not allowing them to suffer through deficient supplies of water or of weak liquid manure. Gently damping the foliage, walls, floors, and closing at about 3.30 P.M., or as early as safe, will insure the swelling of the fruits to a good size.

Where the plants are showing blossom fertilise the flowers daily to set the fruit, insuring a dry condition of the atmosphere, and admitting a little air constantly, especially in moist weather, so as to prevent the deposition of moisture on the blossoms. It is also not advisable to use the knife more than can be helped during the setting period, but pinch out the points of the shoots one or two joints beyond the fruit. Earth the plants when the fruit is set and swelling, and examine them frequently for the removal of superfluous growths, not allowing them to interfere with the principal foliage. A slight shade from powerful sun is very beneficial, but it should only be had recourse to for preventing flagging and scorching.

I think, though it may be prejudice, the best flavoured Melons are those produced in pits and frames. The plants appear to be supplied with a steadier temperature and more uniform moisture at the roots, with the constant, though imperceptible, evolving of ammonia and nourishment. Fruits on the earliest plants should be well exposed to the light, but it is not advisable to do so suddenly, as they may be scorched and hardened in the rind, thus spoiled in appearance or made liable to crack. The fruits may be raised on inverted flower pots, with a piece of slate for the fruit to rest on, as the moisture arising from beneath will cause it to decay. Admit air freely, and water only to prevent the foliage flagging.

As a rule early plants in pits and frames will give a second crop of fruit of just the right size for breakfast and luncheon. To secure them encourage four shoots from the base of each plant, so that when the fruit is cut the old growths may be removed and the young shoots substituted. These will show fruit freely on the first laterals, every alternate lateral being rubbed off to prevent overcrowding, and stopping the leaders about 1 foot from the sides of the frame. If a top-dressing of fresh compost be given, supplemented with a judicious supply of moderately weak liquid manure at 90°, the plants will be assisted to make a vigorous second growth.

I find late Melons from frames much appreciated, and useful crops may be obtained by making up beds now of any spent material, which from mixing and turning will generate a gentle warmth, placing frames over it that may have been used for Potatoes and bedding plants. Put in each light a barrowload of rather strong loam, mixed with a fifth part of old mortar rubbish or road scrapings if deficient of grit, and press it down firmly. Into this when warmed turn out a strong healthy plant, making the soil compact about the roots, and giving a good watering. If the weather be bright shade for a few days. There is yet time to raise plants from seed for planting in frames at present occupied by tender bedding or other plants, but the Melons should be placed into their fruiting quarters with as little delay as possible. Plants put in the beds early in June usually do well, as they set the fruit in about six weeks, and in a similar period perfect the crop of luscious fruits.—GROWER.

COMMENTS ON HOME AND FOREIGN FRUIT.

PLANTING—MANURING—PACKING—MARKETING.

AFTER our pages were practically filled for the present issue we received from Mr. George Bunyard a copy of the Society of Arts Journal containing his comprehensive paper on "Fruit Growing in Kent," read on the 10th inst. We were unable to attend the meeting, and as, through a possible oversight, a proof of the matter in type was not sent to us in the customary manner, we could not publish the paper at the time, and as to abridge it would be to spoil it, all we can do now in the space at disposal is to reproduce some comments on it by Mr. W. W. Berry, a well known commercial grower of hardy fruits, and Mr. J. Assbee, the able Superintendent of Covent Garden Market. These indicate the character of the paper and emphasise important subjects.

Mr. BERRY said Mr. Bunyard was a prophet, not without honour, even in his own country, and the tenant farmers and landlords of Kent would always be grateful to him for the pioneer work he had done, for the advice he had given, and for the indomitable perseverance with which he had carried out his experiments over many years.

The question of selection and packing of fruit was all-important. If he had 100 bushels of Apples from a tree, he would rather send 60 per cent. of the best, even if he had to throw away the other 40 per cent., but that was not at all necessary. If you picked out the very best, say 20 per cent., and packed them carefully in boxes, and then took a further 40 or 50 per cent. and packed them carefully in baskets, the returns from those two sections would be greater than from the whole 100 bushels marketed in a careless way; there would be a saving in carriage, in packing, and in other ways, and you would still have 30 to 40 per cent. of sound fruit to deal with, which you could dispose of to the "smasher," as the jam maker or cider maker was termed, at a fairly remunerative price. The same thing would apply to every kind of fruit.

Another improvement was the steam cultivation of the land, not only in clearing old woodlands, but even on some of the best land in Kent, where he would not think of planting fruit trees without first thoroughly ploughing it and stirring the subsoil by steam. He recently broke up 14 acres, first ploughing it 9 to 12 inches deep by steam, and then following the furrows with a powerful steel implement to break up the soil underneath, being careful not to bring the subsoil to the top, but thoroughly breaking it up from 21 to 24 inches deep. The whole cost was not more than £2 per acre, if you hired the implements, and that was quite saved in the cost of planting.

Artificial manure was another important point. Any farmer or fruit grower could now be supplied with exactly the manure his land or crop required, and at a moderate price—either prepared bones, guano, or some of the phosphatic manures which had been referred to. One of the principal reasons for which he would recommend these things in preference to farmyard manure, was the economy in application. Apart from the question of weeds, which was very serious, especially with manure from London, the expense of hauling 20 or 25 tons of farmyard manure on to an acre of fruit land, getting it to the plantation, and then getting it out and in amongst the fruit bushes was enormous, whereas if you had a suitably prepared manure, with the proper quantity of potash, phosphates, and ammonia, it would all go in a one-horse cart and be carried out and sown broadcast on the land for 3s. or 4s. On a large scale that saving alone would make a good living for the fruit grower.

With regard to foreign competition, there had been complaints for twenty-five years, but he thought the time had come to admit that the British fruit grower was largely dependent on the foreign and Colonial produce. In the old days a small quantity of fruit could be sold during the season; there was a shop here and there, and fruit was very dear, and when any unusually large quantity was sent to market there was no one to distribute it. The season then only lasted three or four months, but now we had choice fruit all the year round. There were hundreds of shops, stores, and barrows—fruit was constantly put before the public, who were thus educated to the consumption of it, and insisted on having it, and thus the fruit-grower was far better off than he would have been without the foreign supplies.

Reference had been made to the advantage of fruit and Hop growing in keeping labourers on the soil, which was a matter in which he took great interest. Things were looking up a little in every branch of agriculture, and they wanted more labourers than they did a few years ago, but they could not get them. They were often in great straits for men to do a little extra work which they knew would pay for doing. If you went away from the most prosperous districts, up into the hilly and barren parts, you would find only one in three, or one in six of the cottages occupied, but down where fruit and Hops were grown, and near the towns, there was an enormous dearth of labour. Instead of getting the assistance they used to have from the hill country, when there was any extra work, they could not now find it. In the villages where fruit growing was carried on, there was

work during the winter in pruning, manuring, digging, making new plantations, and so on, and he was paying £1000 in wages now, where £100 was paid when he was young; and a house could not be got for love or money, though five miles away there were empty houses, because there was no work for the men to do. The fruit industry, therefore, was a grand thing, and it must be the same in many other counties.

Fruit was becoming more and more popular every day; it had never been overdone yet, except in one year, 1886, when there was the biggest all-round crop of fruit ever known, and at that time the system of distribution had not developed in proportion. There might be a crop now three times as big as that, and it would all go to market, and the public would get the benefit of it. Enormous quantities of hothouse Grapes and Tomatoes were now produced in this country. Mr. George Monro had given evidence before a Parliamentary Committee that in one year he had sold 700 tons of English-grown hothouse Grapes, in addition to those from the Channel Islands, and more than 1000 tons of Tomatoes.

Mr. J. ASSBEE said it was perfectly true, as the last speaker had said, that it was much better to keep inferior fruit out of the market altogether, than to put it in with the better class. He had repeatedly seen the sale of good Apples entirely spoiled because certain growers thought they could get the better of the public by putting inferior ones in with them. There were two distinct classes of buyers: the man who bought the best and gave the best prices, and the man who bought the worst and only paid the lowest price. If you sent a mixed lot, the good man would not look at it, and consequently the lower class buyer must have it, and he would only take it at his own price, and thus the grower often did not realise the cost of carriage, simply through carelessness and stupidity in packing his goods.

Foreign competition in fruit was like foreign competition in everything else—cereals, hay, straw, eggs, butter, cheese, or poultry. Foreign fruit could not be kept out of the market, and it answered a very useful purpose. No doubt it had stimulated the public taste for fruit; the more fruit people ate the more they liked it. He had often wondered what our forefathers did for fruit; the people generally could have had hardly any. He could remember the time when the only thing you could get in winter was an Orange.

The colonies were making great strides in this direction. Cape Colony had recently come to the fore, and within a decade would be sending fruit here which would be a surprise to many people. But it would come in when the English fruit was over. English Grapes were now just finished, and there would be a good opening for Grapes from the Cape. They had a few this year, but nothing to what would be sent in a year or two. It was the same with Apples, which were just beginning to arrive. Men had gone to the Cape from California, who were laying down hundreds of acres of land in fruit, and they would be sending thousands of packages before many years. But it would do no harm to English fruit, which was equal to anything in the world when well grown and properly sent to market.

Further comments followed, mainly on cider-making and spraying, and Mr. BUNYARD, in reply, said he "strongly recommended that all new orchards should be raised on arable land, except for Cherries, for which he could not advise that course. It was true they did well under it, but if there came a severe frost—anything below 24° of frost—the trees would be completely spoiled; and not only that, but where the ground was very well manured, the Cherry trees ran away altogether. He was called in to advise at a place in Gloucestershire, where they had manured the trees highly, and they made enormous growth, 6 feet in a year, but when they got a hard frost, the trees were completely spoiled. To farm a good Cherry orchard, you must let it go on very slowly. With regard to renovation, if you had good sorts, by all means go in for it: but it was useless to take the trouble if the sort of fruit was not good enough to pay for it. With regard to spraying, he had to be very careful what he said. If he advised people to do this, it might be done carelessly, and very grave results might ensue. He knew of a case where a man washed his Apple trees with London purple, and some of it fell on the Gooseberries, resulting in a vast amount of illness. It was a good thing to use where people were sufficiently careful. A man once said to him, 'I never tell people to do it, but I do it myself;' and that was sometimes his position." Mr. Bunyard was the worthy recipient of a unanimous vote of thanks.

GLOBE ARTICHOKE.—I was interested to learn from a gardener the other day on passing his stock of Globe Artichokes, that the foliage is liberally gathered and used for house decoration. I wonder whether many other gardeners employ the leafage in the same way. The flower heads are esteemed delicacies when properly cooked and served, but certainly they do not constitute a popular dish. But the use of the leafage, which is finely formed and noble in appearance, for domestic decoration seems novel. Those who would like to have such will find strong plants to produce it in great abundance.—A. D.

ODONTOGLOSSUM CRISPUM—PURITY AND RAYMOND CRAWSHAY.

THOUGH there were not great numbers of Orchids at the Drill Hall on Tuesday, May 16th, several *Odontoglossums* were shown that were decidedly above the average for quality. Two of these we now reproduce—namely, *Purity* (fig. 94) and *Raymond Crawshay* (fig. 95). The latter is of beautifully rounded form, with sepals and petals of much substance. The colour is white, clouded with rose purple, and with large chocolate blotches. It was exhibited by de Barri Crawshay, Esq., Rosefield, Sevenoaks. *Purity*, as the name implies, is white, save for the slightest rose flushing in the sepals and the yellow on the base of the lip. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, was the exhibitor. Each variety received an award of merit from the Orchid Committee of the Royal Horticultural Society.

CATTLEYA CITRINA.

I AM greatly indebted to the Rev. F. D. Horner, and so I am sure are many of the Orchid-growing readers of the *Journal*, for his very interesting and instructive note (page 381) on this beautiful species. I had hoped that more correspondents would have given us their experience with it, and waited a little in expectation, but this is a busy time of year, and as our Editor recently pointed out, those who are most expert in growing are not always the most expert with the pen, and *vice versa*. Let us hope that later, when the press of work is over, our Orchid readers will give us their experience with this and other "miffy" kinds. The rev. gentleman's experience with *C. citrina* is another instance of successful cultivation following close and careful observation and the adoption of cultural methods to suit the natural habit, likes, and dislikes of individual species.

DENDROBIUM TAURINUM.

Though known and admired for upwards of half a century, this singular *Dendrobium* is as far from being understood as ever, and only on very rare occasions are really well-cultivated plants met with. Unlike many other species that are difficult to do, it does not grow really strongly, even when first imported, and it has become an understood fact that if the plants do not take a good hold during the first season, they are very unlikely to do so at all. When strong, the newly imported stems are a yard and more in height, but such are rarely produced under cultivation. They are quite erect, and the flowers occur at or near the top of these, in many-flowered racemes.

The long twisted petals are brown and purple, the sepals greenish-white, while the lip has raised lines of brown upon a rosy purple ground colour. The lip and petals have been likened to the face and horns of a bull, hence the specific name. The only house it is likely to succeed in is a hot, moist, and exceptionally light one, and during the period of the greatest root activity a large amount of water must be given. It is better not to attempt any drying off, though when the growth is made the plants are better for a short rest. Unless ample moisture is always present when growth is active, insects, and especially thrips, are sure to attack it, and healthy growth will be out of the question.

DENDROBIUM CRETACEUM.

Though not so showy as others in this section the flowers of this species are interesting and pretty, and it is worth a place where a representative collection is aimed at. The pseudo-bulbs are stout, less than a foot high; the blossoms occur at the sides of these, and are milk white excepting the centre of the lip, which is yellow with streaks of crimson. It is best grown in baskets, not far from the roof-glass in the warmest house, well watered during the growing season, but kept cool and dry in autumn and early winter. It is a native of large tracts of country in Northern India and Assam, and was introduced in 1846.

AERIDES NOBILE.

In this fine species the racemes are much larger than in *A. odoratum*, from which it is also distinct in habit and quite a superior

plant in every way. It is questionable in fact if the genus contains a finer species, strong growing and flowering abundantly, the blossoms emitting a delicious fragrance all the time they are open. To get the best results large specimens should be grown and given ample head and elbow room in large baskets and a rough compost of sphagnum and charcoal. So treated we have had it a yard high and as much through with scores of its lovely flower spikes.

DENDROBIUM JENKINSI.

This pretty little *Dendrobium* blossoms much more freely in an intermediate temperature than when exposed to strong heat, and will usually be satisfactory when well established on rough blocks of Apple or other hard enduring wood. The small size of the pseudo-bulbs and leaves prevents anything like severe drying off being practised; but unless it obtains its proper rest it will not flower freely, and this is best accomplished by removing to a cooler house in autumn. The blossoms are orange yellow, with a deeper tint upon the downy lip. It is named after a Captain Jenkins, who sent it home from Assam in 1836.—H. R. R.

EVAPORATED VEGETABLES.

THE factory of the British Preserving Company at Rayne stands on a plateau about 200 feet above the sea, on the edge of the London clay, in the county of Essex, upon a gravel bed 25 feet in thickness, overlaying a bed of clean, sharp sand, bearing ample water of exceptionally good quality, though very hard. In the erection of the factory great attention was paid to the sanitary arrangements and the comfort of the workers, most of whom are young women. The main hall is about 80 by 30, and at one end is the engine and boiler room, at the other the kitchen or copper room, with store room and the workpeople's rooms beyond. On the north side runs an annex, in which are various bags for receipt and storage of the raw material and for sundry subsidiary processes. Outside there is a forge, a tin shop, and a large shed for baskets, mats, and sacks, which take much room. The most scrupulous cleanliness must be

FIG. 94.—ODONTOGLOSSUM CRISPUM PURITY.

observed. The concreted floor of the main hall is channelled, and laid so that the constant flushings of water pass readily away.

The main feature of the large hall (apart from the shafting and numerous machines connected to it by belting, which first catch the eye) is what is called the drying canal. This runs along one side of the building, and has the appearance of an exaggerated wooden counter. Its internal dimension is about 4 feet square, and throughout its length is laid a small tram line, along which run the waggons containing ten or twelve perforated zinc shelves for the prepared vegetables. Outside the canal runs a similar tram line by which the waggons, having traversed the canal, are returned to the end to be again filled and passed through. A hot blast is driven into the canal by a powerful fan, and rapidly takes

up the moisture of the vegetables, so much so that at the further end an exhaust fan with a high number of revolutions is required to extract the moisture-laden air and expel it through an upcast shaft.

The amount of moisture extracted from vegetables differs largely in various kinds, Onions being reduced to about one-tenth of their original weight, and other vegetables to a less extent. The time and the degree of heat required by each also largely differ, and in the knowledge of this lies much of the success of the process. When the vegetables leave the canal the slices are crisp as biscuit, and a slight reabsorption of atmospheric moisture must take place before they are ready for compressing and packing. For this purpose they are spread on a wooden floor, and here again experience is needful in order to seize the proper moment. It is claimed that all the natural and essential qualities of the vegetables are retained without any diminution by this process.

Having described the most important part first, we will now rapidly follow the process of preparation. Down the middle of the room are tables at which the girls stand, each with two baskets on the floor, one on either side. On the table or beneath it are the various small machines for peeling or slicing, most of them very ingenious. The idea of peeling Potatoes in a lathe strikes most people as ludicrous, but it is true. Larger machines for washing Potatoes, Carrots, Onions, and other kinds by rotatory action, and slicing them, stand round the walls, while a notable Pea-shelling and sorting machine of large dimensions makes a sort of centre. Steam-heated plunging tanks occupy one corner, and large butts of cold water another. The machinery in the conserving room is of the newest description, but being commonly used in this country needs no description. It may be well to state here that the vegetables prepared at Rayne are absolutely free from chemicals, and have passed the Government analyst as perfectly pure.

The principal feature of successfully evaporating vegetables is to wholly extract the water without burning or drying up the fibres and tissues that are in them, otherwise the vegetables will not thoroughly re-hydrate again or reassume almost their normal size, while no matter how properly and carefully they are cooked they will be harsh and flavourless, and lose their natural aroma and colour. When properly evaporated each vegetable should retain its own peculiar aroma, essential oil, strength, goodness, colour, and flavour.

Almost every kind of vegetable and herb is capable of being preserved by an evaporating process, and if care be taken to get rid of the moisture contained in them they will keep for an indefinite period in any climate, so long as they are kept covered in a tin box, so as to prevent their absorbing the moisture contained in the air. Radishes, Lettuce, Watercress, and such like crisp vegetables cannot be done successfully, because it is impossible by re-hydrating to get back their natural crispness, which is their leading characteristic.

The time required for the drying process is from two hours and a half to four hours, starting from a gradual heat up to 45° to 75° Celsius, such heats varying according to the vegetable dealt with. It is inadvisable, as also almost impossible, to lay down a fixed rule as to the temperature required, as the condition of the vegetable, whether a wet or dry season, its growth, and even the soil upon which grown, have to be taken into consideration.

The process of evaporation does not in any way alter the condition of the vegetable so treated either in making it fresher or staler. Fresh vegetables will come out from the process fresh, and stale vegetables cannot be altered, but will come out stale. The best time to put the vegetables through the process is when they are at their full growth and their nutritive qualities at the highest point. Vegetables grown on sewage farms or on very highly manured market gardens are not the best for the factory, as in both cases they contain a much higher percentage of water than those grown on less quickly forcing soil, and it is an open question as to whether they would have such good keeping qualities when grown on the former as on the latter. At the same time it is important to avoid using vegetables that are grown on poor soil, which consequently are a long time growing, and must be necessarily coarse and spongy, in the case of roots and such like, and stringy and tough in the case of Cabbage.

By the evaporation process, all classes of vegetables as they come in season may be preserved and used for culinary purposes, irrespective of seasons, so that Carrots, Turnips, Parsnips, and Onions, these forming perhaps the most useful, may be obtained all the year round in their full nutritious condition and at reasonable prices. Under the old order of things during the months from April to September it is very difficult and expensive to obtain such from natural sources.

When needed for use evaporated vegetables require soaking in water for from two to six hours, according to the sort. After soaking they may be cooked in the same way as ordinary fresh vegetables of a similar nature. Vegetables required for soups need not be soaked so long as those for the vegetable dish. By adopting a sound and proper process of evaporation, and by taking great care for the cleanliness of all the surroundings and quickness in dealing with the produce from the first commencement of the process, which is the peeling, to the last, which is the pressing and packing, the colour of each vegetable and its own natural aroma and qualities may be retained without the use of any colouring matter or chemicals.

For army, navy, and colonial use, where vegetables are scarce or impossible to obtain, evaporated vegetables form a splendid substitute for the original article, and beyond question hold their own far beyond any tinned substitute, both in flavour and quality, while they are certainly much cheaper comparing solids with solids, and very much easier to

handle. By hydraulic pressure, which in no way injures them or militates against their value, it is possible to confine a large quantity of evaporated vegetables in a very small compass, which very materially lessens the cost of transport both by land and sea.

As an aid to agriculture, which is still the largest industry in the United Kingdom, the evaporation business will require a little time to firmly seat itself, but as to its ultimate success, an object lesson may be learnt from France, Germany, and America, the two former for vegetables and the latter for fruit. France was the originator of evaporated vegetables, which were first used prominently by them in the Crimean war in the feeding of their soldiers. Since the Franco-Prussian war, Germany has made very great strides in their manufacture, so that now in that country and in France, factories for evaporating vegetables may be reckoned by the score.

Dried vegetables may be seen and bought in most of the grocers' shops on the Continent, as they have now become universally used by the householders of the great cities and towns. For cheapness, saving of time and trouble in peeling and preparing, for doing away with the

FIG. 95.—ODONTOGLOSSUM CRISPUM RAYMOND CRAWSHAY.

nuisance of the peelings and garbage stored in or near the house, evaporated vegetables should be extensively used in London and all great centres of people.

The gold medal and diploma of honour were awarded to the Rayne vegetables at the Universal Food and Cookery Exhibition held at the Imperial Institute in March last, where they were extensively used in the practical demonstrations.—(*Paper read by MR. R. GORTON SALMOND at the Horticultural Club.*)

ROYAL HORTICULTURAL SOCIETY.

THE TEMPLE FLOWER SHOW, MAY 31ST, JUNE 1ST AND 2ND.

FOR the twelfth year in succession the Royal Horticultural Society will hold its great annual flower show in the Inner Temple Gardens (by the kind permission of the Treasurer and Benchers) on May 31st, June 1st and 2nd. Every year the desire of growers to exhibit increases, and the officials of the Society have a very anxious task in endeavouring to do justice to those growers who regularly support the fortnightly shows of the Society held at the Drill Hall, and yet at the same time to encourage others also to come forward. The space is absolutely limited by order of the Temple authorities; no more, or larger, tents may be erected. Hence every new exhibitor whose entry is accepted means curtailment of the space allotted to previous supporters.

A catalogue of the Show is given gratis to every visitor, and will contain a notice of new and rare plants entered on or before May 23rd; it will also contain a programme of the music to be performed each day by the band of her Majesty's Royal Horse Guards (Blues). The Judges will meet at the Secretary's tent at 10.30 A.M. on May 31st, at which hour punctually the tents will be cleared of all exhibitors and their assistants. The Fruit, Floral, and Orchid Committees will assemble at the Secretary's tent at 11 A.M. sharp, and the Show will be opened at 12.30. All plants for certificate must be entered on or before Friday, May 26th; address—The Secretary, R.H.S., 117, Victoria Street, S.W.; they cannot be entered under any circumstances on the day of the Show.

BERBERIS STENOPHYLLA.

I WAS glad to see the note by "B. S. E." about this fine species, because it is undoubtedly one of the hardiest and most ornamental of the evergreen spring-flowering shrubs. Just now it is at its best everywhere in all sorts of situations, soils, and aspects. Whether planted singly or in masses, it is equally effective, single specimens putting forth long, curved, graceful growths, which, when laden with the light yellow flowers, is very striking, especially so as I saw it recently near Matlock, on a steep bank above a path with the branches high above.

On the 9th of this month I saw a glorious mass of it in a large circular clump near the flagstaff in Kew Gardens, and my wife called my attention to its sweet perfume, which I had not noticed particularly before, and which I found delightful on going to the windward side of the clump, which is several yards in diameter. I saw other clumps of different varieties of Broom and of double Gorse in full bloom in the gardens, but none of them impressed me so favourably as did this Berberis.

It also answers well for a rockery where the crags are large and the planting has to be bold in character. In such a situation the growth spreads over the rocks on every side, and is sufficiently prominent to stand out as a pleasant feature in perfect harmony with the whole scene. As a clothing for walls in exposed situations both it and *Darwini* are invaluable, and as a garden hedge it is thoroughly efficient as a barrier, and is so ornamental as to merit special attention, and induce the inquiry, What is it? A friend of mine has a hedge of it which is now entirely satisfactory. It looks likely to continue useful for a lifetime; it bears clipping well, and has a very neat trim appearance.

I have been told that it is a seedling from *Berberis Darwini*, and that it originated at Messrs. James Smith & Son's nursery at Darley Dale.—EDWARD LUCKHURST.

CULTURE OF CELOSIAS.

FOR the decoration of greenhouses or conservatories during the late summer and autumn months *Celosias pyramidalis aurea* and *coccinea* are enduring and beautiful, and are well deserving extensive culture. The habit is pyramidal, branched or feathery, and the height depends upon the culture. High culture encourages plants $2\frac{1}{2}$ to 3 or 4 feet in height; small pots and high feeding produces very much dwarfier plants; and starving treatment results in smaller plants which not infrequently, from their fine feathery habit, are fully as useful as those which have been more liberally treated. The varieties vary considerably in the mode of growth, though the pyramidal form is maintained in most plants, but some branch very near the base and are grandly feathery to the summit, the branchlets arching over with much grace and elegance. These are the most beautiful.

The tasselled forms are heavier in appearance, being a combination of coarse feathers and small cockscombs. In colour, too, they also vary considerably, pink, rose, crimson, scarlet, orange, yellow, and all the various shades of those colours. Some plants in a young state are apt to show a small comb, and the impression is given that the strain is a bad one, and under the impulse of the moment the plants are thrown away. That is too hasty judgment. *Celosia pyramidalis* is a broken Cockscomb, and a premature comb is not an evidence of bad strain, but we can hardly say it shows a good one. The plants have a tendency to revert after the removal of the heart comb to the comb form. These combs whenever exhibited should be removed, and this will throw more vigour into the feathery parts, causing fine-habited plants and a denser and more compact growth; in fact, judicious and early stopping (confining it, however, to the strong side shoots, and to the upper part so as to preserve the pyramidal form) is essential to freedom of comb, and to produce elegant feathery plants.

SOWING THE SEED.

The culture required is exceedingly simple. From the middle of April to the middle of May is a suitable time to sow the seed, and from those sown early in June I have seen plants surpassing in beauty and freshness for autumn decoration those sown at an earlier period of the year. The seeds require to be sown rather thinly in light moderately rich soil, and should be covered about an eighth of an inch deep. The pots ought to be placed in a hotbed having bottom heat of about 75° , and top heat of 65° to 75° , with a rise from sun heat and air. The seedlings require to have the soil moist, and yet if kept very wet they are liable to damp. It is important they be kept near the glass and be well ventilated, so as to induce sturdy growth.

When the plants have two or three leaves in addition to the seed leaves they should be potted singly in small pots, and not deeper than the first leaves, returning them to the hotbed and shading for a few days. The plants should be kept regularly moist, but still must not be over-watered. Transfer the plants into larger pots as they fill with roots, potting rather firmly. The last shift may be into 9-inch pots, which are sufficiently large for the largest specimens, and at this move the drainage should be liberal, whilst for the others moderate drainage will suffice. The plants, when too tall for a frame, can be removed to a light house or pit, near the glass with light on all sides.

WATERING.

No artificial heat will be needed provided the temperature, by moderate air-giving, be kept up so as to be that of a cool stove. The

plants are the better for light sprinklings morning and evening and the floors and other surfaces kept moist. Liquid manure may be given at every alternate watering after the pots are filled with roots. Plants so grown will be tall and very effective for conservatory decoration. After they are fully developed they require to be carefully watered or they will decay at the stem. If kept very dry the foliage becomes yellow, therefore water only to keep from flagging. The plants will remain in good condition for many weeks.

If dwarf plants are required it is necessary to keep them in small pots, standing upon boards or slates so that they do not root through into the hotbed; liquid manure may be given at every alternate watering and the plants kept near the glass. The soil in potting should be made very firm, and the shifts only two—i.e. from 3-inch to $4\frac{1}{2}$ -inch, and from the latter to 6-inch pots, the sides of the balls at each potting being loosened so as to remove part of the close matting of the fibres. Shade for a few days after potting, as the plants from the loss of fibres would otherwise flag and the foliage suffer. The drainage at the last potting should be liberal, and in all cases it is better to use half-inch bones than crocks. Light turfy loam three parts and one part of old cow manure, well mixed and broken up fine, will grow them perfectly.—PRACTICE.

CHISWICK NOTES.

WALKING through the great vinery at Chiswick the other day, I noticed how very regularly the Vine rods on each side, but especially on the warm side, where growth was more advanced, had broken from bottom to top, and just as well close down as at any point. Yet these rods run up very nearly vertical to a height of some 25 feet. This fact serves to show that if rods be slowly elongated to insure a good break on each section of new wood, that breaks always come year after year from the spurs without artificial aid.

There is a fine set of Peaches and Apricots on the half-standards in the lean-to Peach house, and although these are trying to lift the roof higher, yet they do not prevent the trees on the back wall from setting a fair crop also. The trees now badly need a loftier house, and one should be furnished for them; the house being then planted in single line along the front, so that the trees may be trained over a low curvilinear trellis, as it is best suited for such method of culture. Each of the standard trees is so large that it carries some fifty fruits, and yet very thinly placed. The trees would well repay tucking, and having a large house to shelter them. It is interesting to note that one of the old and early vineries is still heated by a brick flue. The house contains Black Hamburgh only, and will give a capital crop of bunches.

There is, for the delectation of those Fellows who like them, a fine collection of hardy alpine still in pots, whilst of tender plants a very large quantity has been sent out, and propagation by cuttings and seed raising is in progress to secure stocks for another year. Quite a nice collection of *Caladiums* has recently been secured, but these are hardly likely to meet a popular demand. Still their leafage is very beautiful, of that there can be no doubt, and admirers of it are not lacking.

Trials.—There is being made this year provision for ample work for the Fruit and Floral Committees, and interest in Chiswick will not be on that ground at all lacking. For the first-named Committee there is a very extensive collection of Peas again, for raisers of Peas seem to be irrepressible, and will not cease from their labours. It will be interesting later to see what mountains they bring forth.

Then there is already well up a big stock of Potatoes, the majority being new; a very extensive trial of Dwarf Kidney Beans, recently sown, the varieties so far as possible having been grouped according to the colours of the seeds. There is a good trial of Tomatoes in two houses. In the first the plants are about 20 inches in height, very stout and sturdy, and carrying bloom. These comprise about twelve picked varieties, and about ten plants of each. In another house is a later collection, two plants of each variety; and in yet a third house there is that beautiful golden Peach, sport from the old red Peach variety, which proved to be of such delicious flavour at Chiswick last year. Strawberries should also offer a very interesting trial this season, as both one and two-year-old plants are vigorous.

The hardy fruits on tree and bush will also be well worthy of examination. Plums seem to show a capital set. For the Floral Committee there will be numerous useful flowering stocks to overlook. *Pelargoniums*, *Carnations*, *Pæonies*, *Dahlias*, *Chrysanthemums*, *Violas*, and other things will keep that body usefully engaged. It is not well to undertake too many things in one season, but to do what is on trial well. That is Mr. Wright's object, and it is hoped the season will be of a nature to favour his efforts, as without doubt these Chiswick trials are regarded widely with singular interest.

Cauliflowers.—Various members of the Brassica family, but Cauliflowers chiefly, have been grown in considerable quantity at Chiswick to constitute a trial in those gardens during the coming summer. All varieties, sown at the same time, treated alike by being pricked from the seed pans out into frames thinly, and thus helped to grow strongly, so that from a good batch of each representative plants may be obtained to plant out later. It is so much better in trials of this nature to have many more plants than may be needed, as then it is easier to discern how far stocks come true to character or otherwise. There seem to be numerous stocks. The Chiswick soil is none too tenacious for Cauliflowers, but no doubt if fairly compressed and the summer be drippy there will be a good trial.—A. D.

PROGRESS IN FRUIT PRODUCTION.

(Concluded from page 381.)

STRAWBERRY GROWING IN HAMPSHIRE.

"HAMPSHIRE is one of the few counties in which the area of small fruit exceeds that of orchards, the former being returned at 2209 acres, and the latter at 1986 acres. Moreover, the small fruit area increased from 746 acres in 1888 to the extent given above for 1898. This increase is in great part owing to the expansion of the Strawberry fields of the Southampton district. Mr David Cowan, Director of Technical Education to the Hampshire County Council, informs me that about 7000 tons of Strawberries were sent from this district to London last year. Botley and Sarisbury are two of the parishes in which the fruit is extensively cultivated. Mr. Thomas Spencer of Sarisbury is one of the largest growers. About five-sixths of the Strawberry holdings are from $\frac{1}{2}$ acre to 5 acres in extent, a few from 5 to 10 acres, still fewer from 10 to 20 acres, and only four or five over 20 acres, with 35 acres as the maximum. Five years ago about 90 per cent. of the Strawberries were Paxtons, and about 10 per cent. Nobles; but now Royal Sovereigns are superseding Nobles, and in some measure are taking the place of Paxtons. Picking usually begins in the district about ten days earlier than in Kent—in some seasons as early as June 1st, but in others not before June 15th. Nearly all the first week's gathering goes to London; but afterwards three fourths of the Strawberries are sent direct to the midlands, Scotland, and Ireland. The freight to London is a little over 2s. 3d. per cwt., that charge being made on eighteen baskets holding a gallon each, averaging $5\frac{1}{2}$ lbs.

FRUIT IN DEVON, CORNWALL, AND BEDFORDSHIRE.

"Although Devon is the greatest orchard county in England, the extent of commercial fruit plantations, in comparison with that of cider orchards, is small. In South Devon, however, a considerable acreage of Apples, Pears, and Plums is grown for local and outside markets. Strawberries are grown extensively in the Exeter district. The largest market garden in Cornwall belongs to Mr. Frank Craze, who once grew 10 tons of Hesse Pears on an acre, besides bottom fruit, and sold them at only £4 a ton. In another season he grew only 4 tons, and sold the fruit at £16 a ton. The smaller crop not only gave the higher returns, but was much less expensive to pick and market. Liverpool and Leicester are the chief markets for the produce of the market-garden farm, as Mr. Craze has brothers there who are salesmen.

"No more interesting visit has been made in all my wanderings than one which was paid to the Experimental Fruit Farm at Ridgmont, near Woburn. It was established by the Duke of Bedford in June, 1894, with the valuable assistance of Mr. Spencer Pickering, F.R.S., who still acts as scientific director, while Mr. R. L. Castle is the highly capable superintendent of the practical work, carrying out the experiments and recording their results. The farm is 20 acres in extent. The soil is a heavy one, over a clay subsoil, but Apples do remarkably well on it, and Plums fairly, while Pears grow satisfactorily, though the soil is too cold to suit them thoroughly. More time is needed for fully testing experiments with the larger fruits, but it has been found that farmyard has proved much more effectual as a dressing for Gooseberries, Black Currants, and Raspberries than equivalent quantities of superphosphate, sulphate of potash, and sulphate of magnesia, mixed, and nitrate of soda applied separately; but in all cases the manured plots were superior to those which had no manure. In a bed of ninety varieties of Strawberries the fruit decreased in size after the second year from planting, and the decrease has been continuous since. Royal Sovereign and Paxton have done best at Ridgmont, though British Queen has also flourished. Superlative has proved the best Raspberry, Black Naples the best Black Currant, and much less liable to the mite than Baldwin. Whinham's Industry the heaviest cropper among Gooseberries, and Rivers's Early Prolific the most fruitful of Plums. An excellent shelter fence of American Crabs deserves notice, as the fruit makes delicious jam. It is now 12 feet high, but is to be cut back to some extent. The land of the experimental farm is kept admirably clean, and the management throughout appears to be excellent. Fruit growers all over the world have reason to thank the Duke of Bedford for founding and maintaining a trial farm, which has already taught many valuable lessons, and is certain to teach more in the future."

[Though the citations in our issues of April 13th, 20th, and May 11th, with those now published, appear copious, they in reality only represent in a very small way the result of their author's persistent and successful search for information on the important subject that he has investigated so thoroughly. He publishes information from many other districts, but not on the 1000 acres of fruit plantations established by Lord Sudely, because the manager informed him, that as "visitors are not asked to publish an account of what they see on the great fruit farm, it was obviously useless to inspect it." That is Mr. Bear all over—frank and practical. He has executed his commission well, and

persons who are specially interested in commercial fruit production who may desire to see the whole of his report will find it in the last quarterly issue (March) of the Journal above mentioned. It is published by Mr. John Murray, Albemarle Street, London, price 3s. 6d.]

DAFFODILS IN MIDLOTHIAN.

"FIELDS of waving gold!" Beautiful! Entrancing! Enough to stir to ecstasy the most torpid imagination! But "it's a far cry" from Perthshire or East Lothian to Long Ditton, and for the actual vision of the average Scot the golden fields of the Messrs. Barr might wave and shimmer in vain. So conferred the writer and two friends who kept "tryst" on a recent Saturday at Waverley Station, Edinburgh. The day was piercingly cold, and the rain almost "slanted" not before the baffled wind." Still, enthusiasm defied the unkindly elements; off they set, and in time the quietly-jogging N.B.Ry. landed them at Penicuik, their destination, when a few minutes found them in the gardens of C. W. Cowan, Esq., at Valleyfield, which may well take position as the Mecca of the northern Daffodil devotee. The "Daffs" were there, cowering and quivering in the biting east wind and the pitiless rain, and the three pilgrims shivered in sympathy. Under overcoat and umbrella fully an hour was spent, and enough was seen to require only the quiet courtesy of Mr. Cowan to lay the foundation for a future visit. The following Saturday, therefore, found the trio again in Valleyfield, where now the Daffodils smiled and nodded welcome in the bright sunshine, though yet bitter nor'easter.

And what of Valleyfield and its treasures? Everything seems to be there in the way of Daffodils, and Daffodils everywhere. "Daffs" in the grass, under fruit bushes to test their alleged "fighting" qualities, in specially prepared beds, in the ordinary garden soil, in sunshine and in shade, everything to meet their wants, and the very air seems surcharged with the germs of the "yellow fever." So those that have any natural tendency to such affection had better avoid Valleyfield, or make up their minds to be caught.

Writing so far from memory, I may slightly err in locating some of the lots selected for mention. The first sample prepared us for anything to follow. Half a dozen Monarch, big in size and in price: three dozen at least of the chastely beautiful Madame de Graaff; a large number of Madame Plomp; Glory of Leiden in quantity; Nelsoni aurantius, with its striking cup, are a few examples culled from a bed detached, raised, and specially prepared. Still, there they looked not a whit happier than their comrades in the garden.

This fine corps reviewed, attention is now drawn to several large beds at a little distance. Here all the sections are fully represented, and it is difficult to decide with which to begin. But a batch of several hundreds of Leedsi Duchess of Westminster commands notice; Gem, with its beautiful form and pale lemon cup; the favourite Katherine Spurrell; Minnie Hume, one of the best, with its pale wide cup; and Grand Duchess, a very striking flower, with cup stained orange, may be selected as fine examples of their class.

Of the Bari section, Sensation at once catches the eye, with its pure white perianth and scarlet edged cup; the rarer Crown Prince, with cup stained scarlet; lovely Flora Wilson; and, of course, conspicuous, a universal favourite.

Dozens of Incomparabilis C. J. Backhouse, with long orange-scarlet cup; James Bateman, of exquisite form; Mabel Cowan, smaller than the preceding, but not less beautiful; lots of Queen Sophia; the more costly Lulworth, in perfect form; and Gloria Mundi, not yet often seen, its large and deeply orange-scarlet stained cup contrasting finely with the pure yellow perianth, may be noted as a small selection. Here also is Lady Watkin, as yet in few hands, and apparently not of robust growth.

The Nelsoni section is complete, every member present. Besides aurantius, already noticed, Mrs. Backhouse, with large yellow cup, and Stanley, smaller, but not less attractive, with fine yellow cup and pure white perianth, were noted. Is any member of this class lovelier than the more common Nelsoni major, accessible, too, as it is to the ordinary purse?

Coming to the Burbidgei division, Crown Prince, a charmingly pure flower, with cup of light yellow and orange edge; Ellen Barr, somewhat similar, and a worthy companion to His Royal Highness the Prince, and St. John's Beauty, of peculiar ridgy perianth, with cup of sulphur, frilled and scarlet edged, could not be passed.

And now we come to a remarkable company, a gathering of stalwart knights and fair dames of surpassing beauty. Mark a good dozen of that fine flower Captain Nelson, one of the most desirable, but still somewhat high in price, of great refinement and superb form. The Captain leads a notable corps of both sexes. A large batch of the dapper J. B. M. Camm, evidently in high favour, with Mr. Cowan beside him, following somewhat later Miss J. B. M., a sweetly mated pair, of relative size, not unusual in actual life; and the charming Mrs. Walter Ware, of highest purity, both in the white perianth and golden trumpet, are there in numbers. Let sweet Corrie Plomp follow—perhaps she ought to precede

them all—a flower with perianth of purest white, and trumpet primrose somewhat like that of Grandis in form, a bloom to haunt the memory when first seen. Apricot, more curious than beautiful; Golden Nugget, well named; Lady Helen Vincent, a perfect harmony in colour, and of grand form; Lord Aberdeen, a strikingly commanding bloom, with rich golden trumpet; Mrs. Morland Crosfield, perhaps the finest of all, the perianth of pure white, the trumpet pure yellow, large and bold: Victoria, fortunately of reasonable price, with erect carriage that well displays her exquisite properties of broad, creamy perianth and large golden trumpet; Primrose Dame, a beautiful self-coloured bloom, also attainable to ordinary means, swell the grand group. Shakespere, as he well merits, towers high in this goodly company, and, next to Corrie Plomp and Mrs. Crosfield, most charmed his three interviewers. To bring up the rear, but foremost, in size at least, comes Weardale Perfection, of which (it may seem an instance of the proverbial sour Grapes) the remark may be made that the flower is immense and the price forbiddingly high.

In grass were noted Emperor, Horsefieldi, Sir Watkin (and breaks of all three, in the garden, of some 40 yards long by at least 2 broad), Johnstoni Queen of Spain, and moschatus of Haworth, the last in smaller numbers. Mr. Cowan also showed his visitors a bloom of Johnstoni Mrs. George Cannell with elegantly reflexed trumpet, a variety not often met with. The foregoing are a few selections from the "Daffs" at Valleyfield.

And now one wonders that, from such a collection, while he comes away satisfied that he could see nothing more or have been more highly gratified elsewhere, there remains the sense of completeness rather than of vast extent. Perhaps that is owing to the compact system of planting at Valleyfield, the whole stock being lifted annually, and, while there is not the very slightest appearance of crowding, the plants are close and the ground fully occupied.

After hours of pure enjoyment among the Daffs, and a call a mile or two off in pursuit of Auriculas, three gratified, if somewhat exhausted men, parted in Auld Reekie, full of the delights of their visit, with a sense of deep obligation to Mr. Cowan for his genial reception of the wanderers, and the kind attention of Mr. Shillington, his gardener. A missed train connection entailed on the writer an additional six miles' walk to reach home, but in the gathering gloom of night bright reflections on and from Valleyfield seemed to brighten and shorten the way.—A NORTHERN AMATEUR.

KENTISH FRUIT PROSPECTS.

AFTER a fortnight's splendid weather from a fruit grower's point of view, much of the backwardness, so apparent three weeks ago, may be considered a thing of the past. All kinds of fruit have made grand progress, and if we can only get through the next few days without frost a full fruit crop is practically a certainty. Raspberries and Strawberries are perhaps the slowest to respond to the genial climatic conditions; they have not been looking well all the late winter or early spring, and many pieces now are looking slack and unhealthy. Wireworm is unusually prevalent this season, and they are responsible for much of the damage to Strawberries. Rape cake applied as a manure, say twice from Christmas to April, is about as good a preventive for wireworm as any. An extra coat of manure of any kind is good practice under these conditions. It helps the plant to grow away from its enemies.

Raspberries are suffering from the after effects of one or two extremely dry summers, and also from attacks of the weevil peculiar to them. These weevils can only be destroyed with one wash—viz., Paris green—and the application is rendered very difficult from the fact that unless the wash is made of sufficient strength to almost do harm to the foliage the insects cannot be killed. If the acreage to be sprayed is not too large a good plan is to start washing at, say, four to five o'clock in the afternoon, keeping on as long as one can see. In this way the risk of burning the foliage is reduced to a minimum, as it is the effect of the sun immediately after the wash is put on that causes the mischief. The Raspberry weevil is very hard to thoroughly get rid of. A great many fields have been condemned almost solely from this cause; but if the arsenical washes are used as strong as possible, and often enough, they are to be cured. Raspberries are very gross feeders, and it is always well to increase the quantities of manure applied when anything goes wrong.

Now is the time growers should watch their Damson and Plum trees for aphids. The same things will come on Black Currants too, and, unless they are caught in the first stages, the washings to get rid of them have to be on a much larger scale. Damsons are painfully subject to these pests, and where a grower has a good stock, looking as if the fruit will hang thickly, it would be by no means lost money to wash them, waiting till the showery days are over, during the next week or so, whether they apparently wanted it or not.

Under the influence of the beautiful weather, Apples, Cob Nuts, and the fruits that generally suffer from the winter moth caterpillar, are coming along at such a rate that the caterpillars do not seem to be any trouble to them. Should the warm weather continue, no more spraying will be necessary; but directly the wind goes east—for, say, a week at a time, and it often goes there for longer than that in May—another washing will be certain to do good, if it is not absolutely necessary. Cultivation is in a very forward state. The occasional showers have made land work easily, and yet there has been sufficient dry weather to kill weeds.

As remarked above, prospects for a good crop of fruit are encouraging, and I would urge growers to remember their trees and bushes in the

matter of a little manurial help where they give promise of being heavily laden. In Gooseberries and Currants, a little rapidly working artificial, say 5 to 7 cwt. of fish guano—care being taken to buy that of a good analysis—per acre, is a wonderful help in five or six weeks' time. With Apples and Plums a dressing of well-decayed farmyard manure on the surface is about the best way of assisting them through a heavy yield. The most advanced growers invariably assist their fruit trees through a crop in some such way.

A very few green Gooseberries were to be seen on Saturday. They sold extremely well, but they were dearer at Whitsuntide this year than they have been for ten or fifteen seasons. Some were sold at a fabulous price.—EXPERT, in "South-Eastern Gazette."

ROBERT FORTUNE, PLANT COLLECTOR.

(Concluded from page 412.)

IN 1848 Fortune was off again to China in the employ of the East India Company, for the purpose of introducing the Tea plant into India, which he so successfully did, as related in our "Port of London" papers. It was on this journey, described in his "Tea Districts of China and India," that he discovered and sent home that beautiful tree, the Weeping Cypress (*Cupressus funebris*), which he found growing in grounds of a country inn at Shang-i-yuen. In an old garden at Tung-che he found the charming *Berberis japonica*.

"Having taken a survey of the place," he says, "we were making our way out when an extraordinary plant, growing in a secluded part of the garden, met my eye. When I got near it I found that it was a very fine evergreen *Berberis*, belonging to the section of *Mahonias*, and having, of course, pinnated leaves. Each leaflet was as large as the leaf of an English Holly, spiny, and of a dark shining green colour. The shrub was about 8 feet high, much branched, and far surpassed in beauty all the other known species of *Mahonia*. It had but one fault, and that was that it was too large to move and bring away. I secured a leaf, however, and marked the spot where it grew, in order to secure some cuttings of it on my return from the interior."

In the Bohea ranges "a fine species of *Abelia* was met with on the Fokien side of the mountains, which will probably be a favourite in English gardens. Its flowers are as large as those of the *Weigela rosea*, of a blueish tinge, and bloom in great profusion for a long time. When I first saw the plant I took it to be the *Abelia chinensis* of Brown, but I observe that Dr. Lindley, to whom the plant was sent for examination, calls it *A. uniflora*. It is a curious circumstance that Dr. Abel, after whom the genus was named, discovered his plant on the same mountains, about a hundred miles to the north-west of the spot where the *Abelia uniflora* was found. He was then on his way with the embassy from Peking to Canton."

In a garden at Shanghai he had another find, which at first he mistook for a Holly. This was *Skimmia Fortunei*, producing a profusion of whitish flowers, deliciously scented, and afterwards becoming covered with bunches of red berries like our common Holly. "Its glossy evergreen leaves and neat habit add greatly to its beauty, and will make it a general favourite when it becomes better known"—which is exactly what happened, for it is one of the best town evergreens we have in our gardens. In another garden to the east of Shanghai he lighted upon the yellow *Camellia anemonæflora*.

In 1852 he was deputed a second time by the East India Company for the purpose of adding to the collections already formed, and particularly of procuring some first-rate black Tea makers for the experimental Tea farms in India. It was during his residence in China on this occasion that he discovered that handsome Conifer *Pseudolarix Kämpferi*, called by the Chinese the Golden Larch, probably from the rich yellow appearance which the ripened leaves and cones assume in the autumn. Another discovery worth noting was *Farfugium grande*, the beautiful herbaceous plant with variegated leaves, which he came across at Ningpo, as related in his "Residence Among the Chinese."

But perhaps his most gratifying journey was to Japan in 1860, which yielded new plants literally by the dozen. The glorious *Thujopsis dolabrata*, the male *Aucuba japonica*, the umbrella-like *Sciadopitys verticillata*, that handsome evergreen *Osmanthus aquifolius*, the queen of Primroses *Primula japonica*, the fine Oak *Quercus sinensis*, and above all the lovely *Lilium auratum*, gathered as it grew wild on the hillside, were among the many garden favourites discovered and sent home during this eventful expedition. Had this been Fortune's only journey, it would have been enough to immortalise him. In the course of it he took another trip to Shanghai. "The steamship 'England,'" he remarks in his "Yedo and Peking," "being about to return to Shanghai, I availed myself of the opportunity to go over to that port with my collections, in order to ship them for England, there being as yet no means of sending them direct from Japan. Mr. Veitch had also put his plants on board the same vessel, so that the whole of the poop was lined with glass cases crammed full of the natural productions of Japan. Never

before had such an interesting and valuable collection of plants occupied the deck of any vessel, and most devoutly did we hope that our beloved plants might be favoured with fair winds and smooth seas, and with as little salt water as possible—which fortunately they were.

Some of the things he met with in Japan were really wonderful. For instance, he saw a specimen of *Wistaria sinensis* which measured, at 3 feet from the ground, 7 feet in circumference, and covered a space of trelliswork 60 feet by 102 feet. One of the racemes of bloom he measured was 42 inches in length. The thousands of long, drooping, lilac racemes had a most extraordinary appearance. People came from far and near to see the tree during the time it remained in bloom; and, as it was in the garden of a public tea-house, it brought an extensive custom to the proprietor.

In his description of the Japanese flora he becomes enthusiastic.

"All countries," he says, "are beautiful in spring, but Japan is pre-eminently so. The trees were clothed with leaves of the freshest green, and many of the early flowering kinds were in full blossom. The

FIG. 96.—MR. ROBERT FORTUNE AT THE AGE OF 54.

double-blossomed Cherry trees and flowering Peaches were most beautiful objects, loaded as they now were with flowers as large as little Roses. Camellias, forming goodly sized trees, were common in the woods, and early Azaleas adorned the hillsides with flowers of many hues. Here the *Azalea obtusa*, with flowers of the most dazzling red, was peculiarly at home. *Cydonia japonica* (otherwise *Pyrus acanthus*) was seen in a wild state creeping amongst the grass, and covered with red blossoms; Violets, often scentless, covered every bank; and several varieties of Primrose were met with under trees in the shady woods."

A delightful task it must have been to wander amid such a wealth of loveliness, and pick and choose that which he thought would be appreciated at home; but it is difficult to give an idea of his work without becoming a mere cataloguer of systematic names. It is almost safe to say that there is not a cottage garden in England of any size which has not in it something which was introduced by him.

We have mentioned a few of his captures, and there were scores of others. The winter Jasmine (*Jasminum nudiflorum*), whose bright yellow blooms adorn its leafless stems in January, was his; so were the variegated Japanese Honeysuckle, the variegated Oleaster, and the variegated Kerria. To him we owe the Golden Bell (*Forsythia*), the Chusan or Pomponne Chrysanthemum, the double Bindweed (*Calystegia pubescens*), many now common species of *Pæony*, *Azalea*, *Berberis*, *Clematis*, *Euonymus*, and a hundred others. There is no man who left a broader mark on English gardening than Robert Fortune.

COTONEASTER HORIZONTALIS.—This is a very handsome plant for a wall or for a rocky bank; its fan-like spreading branches and glossy green foliage giving it a distinguished appearance in comparison with others of the family. Although it is not, I understand, a rare plant, it is one apparently not in common cultivation.—E.

TOMATO WINTER BEAUTY.

WITH all due respect to "A. D.," page 370, and without any wish to say anything to detract from the merits of the new Tomato so well grown and shown by Mr. Mortimer, I am of opinion that the Fruit Committee of the R.H.S. was not justified in departing from the rule that has been followed in so many other instances—viz., that of having promising Tomato novelties tried at Chiswick.

I thought the Committee a little too hasty when I read the report, and the illustration of the house of plants given on page 387 of the *Journal of Horticulture* confirms me in that view. Topping plants naturally favours the growth, and hastens maturity in the case of two or more clusters of fruit set on them, and has had much to do with the earliness of the fruit on Mr. Mortimer's plants. If these had been shown a fortnight or three weeks earlier I should have been better pleased. At the time the Committee held the meeting, we could have shown baskets of Early Ruby, equal apparently to Winter Beauty, and 50 lbs. of Cropper were sent that day to a commission salesman, all perfect in form and beautifully ripened. These were gathered from heavily cropped plants, not topped till the ridge of the house was reached. I much regret now not having had this house photographed, but justice could not have been done to the crop without sacrificing far more leaves than was desirable.

The fruits in the photograph more resemble Conqueror than Perfection in form. Big fruit may strike "A. D." as being desirable, and Londoners evidently are not very particular. But try the provinces.—MARKET GROWER.

[The fruits referred to were grown in the provinces, and their merits estimated by provincial judges.]

MANCHESTER WHITSUNTIDE SHOW.

THE gardens never looked better than in the early morning of last Friday, when the preparations for the great Whit-week show were in full progress. But later in the day the sky became overcast, and rain fell heavily. It is only at such times that the services of the grand exhibition house and the fine promenade can be fully appreciated, and here at all events something approaching a hall for horticulture can be found. In comparison with former shows the present one was not so large, and one missed such well known firms as Messrs. Sutton & Sons, B. S. Williams & Son, Sander & Co. of the trade, and Messrs. E. Ashworth, T. Statter, W. Thompson of Stone, F. Hardy, and others who are so intensely interested in everything connected with horticulture. Their absence is, we hope, only temporary, in fact in one or two cases we know that the peculiar spring had not developed the blooms as quickly as usual. Mr. Weathers, and Mr. Paul his assistant, had all in readiness for the judges, and what was missing in quantity was more than compensated for by the perfect quality of all concerned.

Mr. Cypher of Cheltenham was the chief exhibitor, arranging a most beautiful group. Mr. Robson of Bowdon, who was placed second, had some handsome types on evidence. Mr. Heath of Cheltenham was third. For the best collection of Cattleyas and *Lælias* Mr. Cypher won in a decisive manner, and also for ten specimens of Orchids in bloom; a grand *Cymbidium Dayanum* being noticeable. Mr. Heath was second. For ten stove or greenhouse plants Mr. Cypher was the only exhibitor.

In the amateurs' section for six plants, Mr. Wilkes, gardener to Miss Lord, Ashton-on-Mersey, was first, his *Ixoras* and *Clerodendrons*, although somewhat early in the season, were well bloomed. He also won with six and one fine foliage stove plant and flowering greenhouse plant, other single specimen classes being taken by Messrs. J. McIntyre of Darlington and H. Storey of Brooklands, the former securing the class for ten exotic Ferns with fair specimens, Messrs. W. & J. Birkenhead being second and first for ten hardy Ferns.

Gloxinias were in numbers and of good appearance, *Calceolarias* and *Cinerarias* small but fresh, *Begonias* very moderate, *Pansies* and *Violas* telling in colour. Herbaceous plants were admirably arranged. The winners were Messrs. Harker, R. A. Naylor, Thelwall; Mr. Morgan, gardener to Mrs. Fildes, Debroyd Castle, Todmorden; and Mr. E. Donner, Fallowfield. The well-known and highly respected Rose-grower, James Brown, Esq., Ashton-on-Mersey, won with some choice Roses arranged for effect. *Coleus* and *Caladiums* were capital, Mr. Baxter winning with six of each, Baron Knoop with *Adiantums*, and Mr. F. W. Travers with table plants.

Groups of 250 feet space for nurserymen were of excellent quality, the prize card giving the award to Mr. A. J. Bruce, Chorlton-cum-Hardy, who had interesting plants decidedly lacking in brightness. Messrs. R. P. Ker & Sons, Aigburth, were second. For 200 feet Mr. J. McIntyre, jun., seemed to have the gift so well used by his father on previous occasions. It was a study of the highest importance. Mr. Wilkes went in for scarlet and white with much effect, but the background was too symmetrical. Mr. Morgan also displayed more than ordinary talent in the first prize group of 100 feet, and he was closely followed by Mr. Baxter.

The trade exhibits were of the highest excellence. L'Horticole Coloniale, Ltd., excelled all previous efforts with *Odontoglossum crispum* Countess of Derby, rose with crimson blotches; *O. vexillarium vittatum* (fine); *O. vexillarium candidum*, splendid light type; *O. Adrianæ tigrinum* (extra); and *O. Ruckeri* Queen Victoria, very handsome, all gaining certificates. A gold medal was also awarded. A similar compliment was paid to Messrs. Charlesworth & Co., Bradford, for a splendid strain of *Odontoglossum crispum*, one amongst many being labelled

"Georgina," very large white flower with brown spots, F.C.C. *Odontoglossum harvingtense*, a natural hybrid between *crispum* and *triumphans*, the latter preponderating, was especially interesting in every way, F.C.C. Mr. John Cowan, of Gateacre, Liverpool, had a choice and varied bank, the varieties being of the usual type for which the firm has become so noted. The gold medal was richly deserved. Messrs. H. Low & Co. had distinct quality to recommend them, *Odontoglossum Andersonianum giganteum*, some 5 inches in length; also *Cattleya intermedia alba*, being singled out of many good things for F.C.C. Silver medal. A silver medal was also granted to Messrs. J. Veitch & Sons, Chelsea, for a stand that fully maintained the reputation of the firm.

Mr. Jno. Waterer, Bagshot, had the finest exhibit of *Rhododendrons* ever seen at Manchester, the award to the handsome "Pink Pearl" being fully justified. Mr. Cypher gained a F.C.C. for *Cattleya Mendeli Princess*, a great beauty. Mr. Duncan Gilmour, Sheffield, helped materially to swell up the exhibition, the *Cattleyas* being very fine. An A.M. was given to *Cattleya Mendeli Ajax* (silver medal). Messrs. Clibran & Sons of Altrincham had a select bank of handsome flowering and foliage plants, a new *Pelargonium Oldfield Defiance*, of almost a blue shade, and their dwarf strain of *Salvia splendens*, looking excellent. Messrs. Dicksons, Ltd., showed their yellow Tree Carnation *Duchess Consuelo*. It is a true yellow self, and very free. *Auriculas* and *Polyanthus*, loved by all Manchester workmen, were also to be seen. Messrs. Webb & Sons of Stourbridge had a choice strain of *Calceolarias*, and the Misses Hopkins of Knutsford catered for lovers of herbaceous plants.

THE YOUNG GARDENERS' DOMAIN.

CARROTS.

CARROTS form one of the most important root crops. They do not require a soil that is specially manured for them, but one that has been thoroughly prepared mechanically, and of course which contains ample nourishment. In order to maintain a supply of young tender roots it is necessary to sow frequently. We commence with the first sowings on hotbeds during January or February. This crop is subject to depredations from mice and slugs, and proper precautions must be taken. As soon as the plants are large enough to handle with safety they must be thinned to 2 or 3 inches each way, reducing in number a few weeks later. Early French Horn and Early Nantes are suitable for frame culture, they also are of excellent quality. Sowings of these two varieties can be made on a south border in February, and where the soil is light and warm serviceable roots can be obtained early in May.

Main crop sowing commences in the open quarter in March, and frequent successions of the short or stump-rooted varieties are made. These I think are the best, as they give a quicker return than the intermediate and longer sorts. No more seed should be sown than will give a supply for from three to five weeks, as the roots are liable to become coarse if overgrown. Carrots grown in this way do not require much space; 5 to 6 inches between each row is ample, and one operation of thinning is sufficient until they attain a size fit for table. A few of the best varieties for sowing in the open ground are Champion Horn, Model, and Searlet Horn.

Although Carrots are preferred drawn from the open ground, it would be a mistake if a reserve were not stored for winter use. This necessitates a main crop of the intermediate type. The seeds should be sown in drills 12 inches apart, the time depending largely on the locality and the soil. I have seen first-rate Carrots obtained from seed sown in May, but soils differ so much that each cultivator must use his own discretion as to the time of sowing.

A valuable crop I consider is that which is from seeds sown at the latter end of July, as if protected during severe weather with thatched hurdles or straw litter it affords a supply of young crisp roots for winter use. The varieties mentioned for early work are well adapted for late use.—E. W. G.

CELERY.

AMONGST the many comestibles at present grown, Celery holds a very prominent place, it being one of the most valuable that the vegetable garden lays claim to. It is ever in request, both early and late, and the demand for it is increased by the variety of ways in which it can be used; and it is the object of every gardener to supply the requirement over as long a period of time as possible.

To have it ready in August or September the seed should be sown early in February, and in March and April for succession. Sow in pans of light soil, and place them in a temperature of 70°, keeping the surface moist until the young plants appear. When large enough to handle transplant them 2 or 3 inches apart in boxes filled with a rich compost, having first placed a layer of well-decayed manure in the bottom of the box. Put in moist gentle heat until the plants become established, when they may be gradually hardened, but care should be taken not to give them any severe check, or failure may be the result by the plants starting prematurely to seed. Plants from later sowing may be transplanted into frames, or on warm sheltered borders.

Soil that is naturally moist and inclined to be heavy is best suited for the cultivation of Celery, and a piece of ground answering to that description should be chosen if possible. If it is clear of other crops it will be benefited by being roughly dug over during winter. About the first week in May the trenches may be prepared, allowing a space of 6 feet from centre to centre, making them 18 inches wide and 9 inches deep. Break up the bottom with a fork, put in a layer of 6 or 8 inches of well decayed manure, dig it over again to mix it with the soil under-

neath, thus providing a deep, rich, rooting medium in which the plants will grow and withstand drought better than would be the case with shallow trenches. Make the surface even, and put back a little of the soil that was taken out, and the trench will then be ready for the young stock, which may be planted when ready or as soon as the weather permits, choosing, if possible, dull damp weather for the operation.

Subsequent treatment will consist in removing weeds, and keeping the plants free from suckers, and in watering, tying, and earthing. On light soils more water will be required than on soils of a heavier nature; but one learns from experience that much more water is often recommended and given that is necessary, with the result that the tissue is soft, and the stalks hollow, while it does not withstand the effects of winter so well as when it is in that firm and crisp condition which is so essential to good, well grown produce. When the trenches are well manured, there is always a steady and continued supply of moisture, and this, on some soils, and in ordinary seasons, will be almost sufficient.

The summer of 1898 was exceptionally dry, and our Celery got very little water, for the simple reason that it was very scarce; yet it grew well, was crisp and tender, and is still being sent in for use (May 13th), having passed the winter with only a small percentage of decayed heads. The soil is of a heavy nature resting on a blue clay. The earthing should commence early for the early crops, and proceed by degrees, or if it is required for exhibition it may be wrapped round with stout paper so as to exclude the light, and in about six weeks after the final wrapping or earthing it will be ready for use.—S. P.

HARDY FRUIT GARDEN.

Strawberries.—A liberal mulching of fresh manure, or half short and half long material, must be applied to Strawberry quarters where the plants are promising well for producing a crop of fruit. Feeding the plants may with great advantage be practised now. Soot is a good stimulant, and may be dusted freely round the crowns and watered in. Its presence will not only be beneficial to the plants, but inimical to slugs, which may be troublesome when the fruit begins to ripen and in damp weather. One ounce to the square yard of nitrate of soda assists heavy crops to swell off satisfactorily. Liquid manure may be utilised if available for all Strawberry plants except the youngest and most vigorous. To obtain fruit of large size and good quality the trusses of flowers should be thinned, and the small and deformed fruits cut out.

Planting Out Forced Strawberries.—These when worth retaining ought to be now planted out. The soil and roots must be thoroughly moist before planting them out in rich firm soil. Mulch well with short manure, and water freely until established. These plants throw out good runners, which are useful for early propagation.

Young Plants.—If the plants placed out early last season have done well excellent crops ought now to be promising. Later planted beds may bear, but not so heavily, while those planted out later still, and during the spring, though showing a tendency to bear by the production of flowers, ought not to be allowed to do so, as the perfecting of a crop of fruit will hinder the vigorous growth of the plants, therefore nip out the flower trusses this season, and the benefits will be derived next season.

Outdoor Vines.—Where the growths from the spurs are too numerous disbud or cut out the least necessary and unsuitable. The shoots retained must be fruitful or well placed as successional growths. Stop the fruitless shoots at the sixth or eighth leaf, and the others one or two joints beyond the bunch. Tie out the shoots in a regular manner without any crowding. Well situated growths may be trained-in to occupy vacancies, or to eventually take the place of worn out spurs or rods. The growths selected for this purpose ought to be vigorous. Let them originate as near the base as possible. When they have extended to a length of 4 feet stop them at a joint near that point. This will plump up the buds by concentrating the sap for a time, the surplus eventually finding an outlet in extending a fresh leader, which may be allowed to encourage growth. One effect of the stopping is to enlarge the principal leaves, which if receiving plenty of light perform more and better work. Laterals may start from the axils, but these can be stopped at the first leaf. No more shoots should be laid in than room can be found for. Growth is now rapid, and overcrowding quickly becomes evident, necessitating the removal of shoots more severely than desirable, which gives a check.

Peaches and Nectarines.—Disbudding or rubbing off shoots must now be discontinued, as the growths are becoming too long and woody to be easily rubbed off. The new growths retained should be fastened in or temporarily laid in in the direction intended for them to grow. They are pliable and readily disposed in a right direction, but later, when they are stiffened, they will not bend. Do not tie or nail in tightly, as room must be left for the shoots to swell. Keep nails away from fruit swelling, whether the iron is old or new.

Every endeavour must be made to maintain the trees in a healthy condition. In order to do this the foliage must be frequently syringed

towards the evenings of hot days, and if red spider should have obtained a foothold, an insecticide will be necessary. Much, however, may be done to prevent attacks of this pest if the soil about the roots is kept moist by copious waterings, and laying on a mulch of half-decayed manure. Healthy trees bearing good crops will need water weekly, and as the fruit swells sewage water may be applied. This assists the crop greatly and prevents its drawing too much upon the tree's resources. Red spider and other insect pests are less troublesome when adequate moisture and food are available for the roots. The fruit should be thinned to the required number by degrees, commencing when they have attained to the size of small nuts. Many of the small and ill-placed can be removed sooner.

Pears and Plums.—Lateral growths which require removal are now beyond the stage when they can be rubbed out, hence where thickly placed they must be cut out entirely. Room is thus afforded for the remaining growths to extend and produce good lower leaves, which will feed the buds at their base. Summer pruning can then be carried out as soon as the lower leaves have attained full size. Pinching the growths when young and soft invariably results in a thicket of growths which ruin one another, as time is seldom available for this form of management. It therefore should not be adopted unless subsequent growths can also be pinched as well as crowded growths boldly thinned out.

Red and White Currants—Sucker growths at the base of bushes must be cleared out, as if allowed they crowd the bushes. A commencement may be made in nipping back the young growths to three pairs of leaves. This will let light and air to the fruit.

FRUIT FORCING.

Cucumbers—Plants that have been in bearing since the beginning of the year in a house may be removed, and the house being cleansed, it can be utilised for a late crop of Melons, or another crop of Cucumbers. Where, however, the Cucumber plants are fairly healthy, and the supply of fruit insufficient from pits and frames, they may be kept fruiting some time longer by removing the surface soil and replacing with some lumpy loam, afterwards surfacing with sweetened manure, giving a good soaking of water or liquid manure. Thin out the old growths and encourage young in the place. Shade from powerful sun, syringe the plants in the morning and afternoon, and damp well before nightfall. Fire heat need only be employed to maintain a temperature of 60° to 65° at night, and 70° to 75° in the daytime. Admit a little air at 75°, increase it with the advancing sun heat, keeping through the day at 80° to 85° or 90°, and close early in the afternoon so as to run up to 90° to 100°.

Plants in pits and frames should be ventilated from 7.30 to 8 A.M., and in the hottest part of the day a slight shade from fierce sun will be beneficial; keep through the day at 85° to 90°, close at 85°, and so early as to raise the temperature 5° to 10° or more from sun heat. Keep the plants watered as required, never allowing them to lack a supply without meeting it promptly and before they are distressed, and not giving needless supplies so as to make the soil sodden. Avoid crowding the foliage, thinning well, maintaining a succession of young bearing wood, removing bad leaves, and stopping the shoots one or two joints beyond the show for fruit. Over-cropping and allowing the fruit to remain on the plants after they become fit to cut greatly weakens them, and must be guarded against by timely thinning and cutting the fruit, which keep some time in a cool place, with the neck end inserted in a saucer of water. Straight fruits are not only handsomer and more easily packed than the crooked, but they possess greater value, therefore place the young fruits in glass tubes, or pieces of deal nailed together so as to form open ended troughs about 3 inches wide.

Peaches and Nectarines.—*Early Houses.*—When trees of Alexander, Waterloo, and Early Louise Peaches, with Cardinal and Advance Nectarines, are cleared of their fruit, the wood that has borne it should be cut to the successional growths from their base for next year's fruiting, except those needed for extension. If the trees are too full of wood thin well, so as to admit light and air to the shoots, and thereby insure their thorough ripening. Early forced trees are liable to have the buds over-developed, and to east them, therefore some growers leave the old wood until a later period to retard the buds, while others shade the house from bright sun with a similar object. Covering the roof-lights with a thin wash of whiting and skim milk answers perfectly, using it as soon as the blossom buds are commencing to form, or from the fruit being gathered until the latter part of August. This is a good plan where trees suffer from over-maturity of the buds, and, with proper regard to watering and keeping the foliage clean, is effectual. Syringing should be practised in the morning and evening to free and keep the trees clear from red spider. The borders must be kept in a thoroughly moist condition, as it is important that the foliage be healthy as long as possible. Admit abundance of air in the daytime when the fruit is ripening, and a little at night to prevent the deposition of moisture on the fruits, which is likely to induce decay at the apex, if not encourage the attack of "spot," which is rather prevalent this year on Figs and Grapes, and in less degree on Peaches and Nectarines.

Succession Houses.—Only moderate artificial heat will now be necessary in order to admit a free circulation of air. Remove any leaves that shade the fruit too much, raising them on laths placed across the trellis, so as to bring them with their apexes to the light. Attend regularly to tying-in the shoots, stopping the laterals at the first joint as soon as made. Any growths that cannot be allowed to extend without crowding or encroaching on others stop at about 14 inches, exception being made of extensions. Shoots retained level with or past the fruit to attract the sap to it should be stopped to one or two joints at each break. Syringing must be practised morning and afternoon to keep red spider under, and the inside

border attended to regularly with water. Admit air early in the day, and in the case of houses glazed with the best quality glass in large panes a double thickness of herring or single pilehard netting drawn over the roof-lights is beneficial in very bright and hot periods, preventing the leaves browning. A little whitewash from a fine rose syringe on the glass also diffuses the light, and acts favourably, and has the advantage that the first rain washes it off, and gives the much-needed light in dull periods.

Late Houses.—Let there be no delay in thinning the fruit, leaving very few more after the fruits attain the size of Walnuts than will be required for the crop, up to which stage the thinning should be gradual, and avoid overburdening the trees. It is better to retain too few rather than too many fruits, fine examples being always appreciated, while the indifferently swelled and quality-lacking are a source of complaint. There is no greater mistake than retaining more shoots than there is room for. If the wood is not properly formed, and is not solidified as made, imperfect buds result. If aphides appear fumigate on two or three consecutive evenings, having the foliage dry, and being careful not to give an overdose; or apply one of the advertised insecticides, carefully following the instructions. Should mildew attack the fruit or foliage dust with flowers of sulphur, taking care to reach every part.

Pines.—*Providing for a Successional Supply of Fruit.*—Pine plants yield, as a rule, the finest fruits when they show these ten to twelve months from the time the suckers are potted, but some allowance must be made for the size of them when started, also for autumn potted suckers, which have to make a part of their growth under adverse influences. Plants that were potted last September will now be showing fruit; if not, means should be adopted to effect it. This can be done by subjecting those of that age not now showing signs of fruiting—a thick sturdy base, and the leaves commencing to open in the centre of the plant—to comparative rest for a period of four to six weeks, lowering the heat at the roots to 75°, admitting air fully at 75° to 80°, and letting the temperature fall to 75° before closing the house for the day. The plants must not be allowed to become excessively dry at the roots, but when a supply is needed, and only then, afford it liberally. The smaller suckers of the plants, placed this spring in the fruiting pots, should be kept growing until they have filled their pots with roots, when, if it be necessary, the plants can be subjected to the same course of treatment as advised for the larger plants, and these will afford a successional supply of fruit.

Potting Successional Pines.—When the strongest suckers potted last March filled the pots with roots, they would be transferred to their largest pots. If they are not yet potted no further delay should be tolerated, as to retain them longer in small pots is detrimental to their after growth. Recently potted plants should have a regular bottom heat of 85° to 90°, and be thoroughly watered after potting if the soil be dry, and no more should be given until the soil becomes again in that condition, as it is necessary to exercise more care than usual at this stage, the state of the individual plants being ascertained before its application.

Young Pines.—Growing stock will be making rapid progress, and should be regularly attended to in every particular. Ventilate early in the day at 75° to 80°, to render the foliage dry before it is acted powerfully upon by the sun. Discontinue shading successional plants, but if very near the glass and the panes large a slight shade will be advisable in the hottest part of the day; also for fruiting plants with the crowns in close proximity to the roof.

THE BEE-KEEPER.

COMMENCING BEE-KEEPING

It makes little difference at what season bees are obtained if the bee-keeper understands their management. We have sent bees long distances at midwinter, and also in the height of summer, without any difficulty. It is, however, important that beginners who purpose making a start at bee-keeping should commence at the most favourable season, and for various reasons we recommend spring in preference to autumn.

If bees are obtained in the autumn there is always the risk of losing them during the winter, either from insufficient food, cold, or dampness in the hives, or queenlessness. There is one advantage in procuring a strong stock of bees in the autumn. If they winter well, and increase is preferred the first year to a surplus of honey, they may be readily increased to half a dozen strong colonies by the following autumn if the original stock is allowed to swarm and the stock and swarm are afterwards divided so as to obtain the requisite number of colonies.

The plan we adopted when an increase of stocks was of more importance than a large surplus of honey, was to encourage the queen to commence laying as soon as the weather was favourable in the spring. This was done on the lines advocated in previous notes—namely, feeding those that were short of stores with warm syrup and uncapping the cells of the others. The brood chamber was also enlarged, in one instance to twenty frames. This hive, we may say, was crowded with bees and the whole of the frames filled with brood by the last week in May.

If an ordinary hive is used we recommend a beginner to allow the bees to swarm naturally, and if a small surplus is desired place them on not more than six frames, which may be filled with comb foundation. If the weather is favourable and honey is coming in freely a crate of sections or shallow frames may be placed on them, and the bees will at once carry the honey up into the super. There will be thus a surplus stored, and a strong colony of bees for wintering.

AFTER MANAGEMENT.

The original stock from which the swarm came may afterwards be divided into as many nuclei as required, care being taken to rear at least one extra queen to replace the old one, which came off with the swarm. It will be better to defer introducing her until the supers are removed, as at least four extra frames will be required to give the bees sufficient space in which to store their winter supplies. If the young queens have been properly attended to, and they became fertilised without any delay, a sufficient number of frames filled with brood may be obtained from the nucleus in which the young queen was raised. The bees may be distributed between the other hives, which will strengthen them, as there will be a strong colony of bees in the hive that was supered, which will increase in strength as the brood hatch out from the combs that were introduced.

Owing to the large amount of honeydew stored by the bees last year they were not robbed of their natural stores as much as they would have been had the honey been of good quality. Bees, therefore, have wintered well, and are plentiful and reasonable in price. There should be no difficulty in obtaining strong swarms of bees by the end of this month should the weather become more settled. We prefer spring, if that pest of bee-keepers, foul brood, is known to exist in the district, as a strong swarm would not be likely to come off from a diseased stock. If there is any doubt in the matter a guarantee should be obtained with the bees. As soon as the swarm is obtained they should be placed on as many frames of comb foundation as they can well cover, drawing up the division board close up to the outside comb, and if the weather is bright it will be an advantage to shade them for a few days, giving more frames as often as necessary.—AN ENGLISH BEE-KEEPER.

•• All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," 8, Rose Hill Road, Wandsworth, S.W., and NOT to 12, Mitre Court Chambers, Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor. Letters of inquiry must be accompanied by the names and addresses of the writers, but these will neither be published nor disclosed when initials or *nom de plumes* are given for the purpose of replies.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and it is convenient when each question is written on a separate sheet. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Physalis Franchetti (S.).—The plant thrives in ordinary garden soil, planted in a bed, and produces abundance of fruits, which are very ornamental when ripe on account of the large, highly coloured, inflated calyxes. It grows taller and more robust than the Winter Cherry, *P. Alkekengi*, hence requires more room.

White Scented Greenhouse Rhododendron not Flowering (Idem).—The plant is probably *Rhododendron jasminiflorum*, and should be kept under glass constantly, not placed out of doors in the summer months. Give it a light and airy, but not draughty, position in the greenhouse, keeping moist, but not over-watering. It does well in a rather small pot—indeed, overpotting is a mistake, as the soil becomes sodden and sour.

Manuring Ground for a Second Crop (O. F.).—It is an excellent and often necessary practice to manure the ground after removing the spring crop, such as Peas, before planting young Cabbages. Rather more than half-decayed stable manure is the best to use. In our experience we have had excellent results in manuring for every crop, applying $2\frac{1}{2}$ cwt. per rod = 20 tons per acre on the double crop in a season system, and up to 40 tons per acre, 5 cwt. per rod, on the one-crop and autumn application plan. In certain cases it is not advisable to use heavy dressings of stable manure, such as for Broccoli, which may be grown too succulent, hence liable to injury from frost in severe weather.

Strawberry Jam (C. C.).—The following is an excellent receipt:—To each pound of Strawberries allow half a pound of sugar. Procure firm scarlet Strawberries (ours are Vicomtesse Hericart de Thury), strip off the stalks and put the fruit in a preserving pan over a moderate fire: boil for twenty minutes, stirring constantly. Remove from the fire and add the sugar, granulated being the best; place over the fire, and boil quickly for another twenty minutes. Put into pots, and tie down while hot, upon which point largely depend the keeping properties of the preserve. We have never been troubled with the mould of which you speak. Most of the fruits have retained their natural shape, while the flavour is all that can be desired.

Datura (Brugmansia) sanguinea (J. C. S.).—This plant is a native of Peru, and requires to be kept under glass until a flowering habit is induced. The point is to secure thoroughly ripened wood, keeping dry and cool during the winter months. Pruning should be done in the autumn. The plant must not be placed outdoors in summer, but given plenty of light in a greenhouse or conservatory. *Datura sanguinea* enjoys a moderate amount of warmth—as that of a vinery when in full growth—and requires to be kept dry and quite cool in winter. During the flowering period liquid manure is most useful in increasing the vigour of the plant and the number and size of the flowers. Old plants flower far more freely than young ones.

Fungus on Mushroom Bed (Condy).—The fungus is known as *Clavaria formosa*. It grows on the ground in woods or wooded pastures, and often forms large tufts 3 to 4 inches in height, sometimes crowded and extending for several feet. We are not aware that it has any injurious properties, and certainly no economic value. It has probably been introduced to the Mushroom bed in the droppings, or with the soil, and has become singularly fine under the favouring conditions. Its mycelium will have impoverished the Mushroom bed and interfered with the development of the Mushroom spawn. We can only suggest removing the fungus growths as they appear, and using a little salt—about an ounce to three gallons of water—for watering the bed, keeping the solution from the Mushrooms showing on the surface.

Diseased Chrysanthemum Leaves (W. H. P.).—The leaves are affected by eelworm, *Tylenchus devastatrix*, and also by a fungus, *Septoria chrysanthemi*, which usually attacks cuttings or young plants. The clammy substance on the leaves is due to eelworm, for which remove the worst infested leaves and burn them. Spraying with methylated spirits, using an atomiser or pneumatic sprayer, so as to coat the leaves with the finest possible film, quickly disposes of the eelworms in the diseased parts, but these will not recover, as their tissues have been destroyed. The eelworms also attack the stems, the plants sometimes dying off at the collar. Dust the plants with tobacco powder, watering the roots with lime water made in the usual way, alternating with kainit 1 oz. to a gallon of water, and following with nitrate of soda, $\frac{1}{2}$ oz. to a gallon of water. For the fungus see reply to "J. F. S." on page 439.

Spots on Forced Strawberry Leaves (D. W.).—Yes, there are some red spider, but not enough to account for the fruit not swelling. The spots on the leaves are caused by the Strawberry leaf-blight, *Sphaerella fragariae*, which appears much on the increase. There is no cure, for the fungus is wholly endophytic, though, of course, the "fruits" discharge the spores externally, hence spraying with Bordeaux mixture, or dusting with a fungicide in powder, prevents the spread if done in time. The mixture, or even powder, containing sulphate of copper, should not be used on the fruit, hence the treatment is wholly preventive, and this is the proper course to pursue with all endophytic parasites. Young, non-bearing plantations, which applies to those in pots, should be sprayed two or three times during the summer. The spraying acts well against mildew, and also against Strawberry mould, always keeping clear of the old foliage as soon as it can be spared—this is, after the crop has been gathered, burning the rubbish, or at least fermenting in a heap and turning over. The heat kills the spores in the perithecia and also the sclerotia.

Erythrina crista-galli not Flowering (J. C.).—This plant is a native of Brazil, yet in the southern counties almost hardy. To flower well it must have a strong loamy soil, abundance of water given when not at rest, and full exposure to bright sunshine. Keep it growing all summer in a warm house, and treat liberally, so as to induce vigorous growth. In September, water should be gradually withheld, so that the wood may ripen, the leaves fall, and the plant go to rest for the winter. Early in spring it must be repotted, placed in a hot moist atmosphere, and supplied with plenty of water at the roots. This treatment should induce the plant to produce large racemes of flowers. In most cases it is advisable to start the plant in heat, as this is conducive to the free production of shoots. As these increase in strength, a lower temperature will be sufficient, till, finally, the plants may be placed outdoors for the summer. After flowering, the shoots die down, when the plants can be placed in a cool frost-proof house, kept dry and at rest until the following spring. Of course, the old stems require to be cut away to the basal or rootstock buds. The plant can hardly be expected to flower in a 5-inch pot.

Dictamnus albus not Flowering (J. S.).—This plant is a native of Eastern Europe, and of Asia. It is of easy culture in ordinary garden soil, preferring, however, a rather dry position. We presume the situation is too moist and cold, hence can only advise a warmer and drier position in the full sun for the plant.

Insecticide for Orchard Trees (Jardinère).—As a general wash for destroying caterpillars, green fly, and red spider—indeed, all orchard pests, good service has been done with arsenite of soda $\frac{1}{2}$ lb., acetate of lead $1\frac{1}{2}$ lb., petroleum emulsion 16 lbs., water 100 gallons. For making, add the materials in the order named, and mix thoroughly. The earlier it is applied the better, or as soon as the fruit is set, but preferably before the trees come into blossom, repeating as soon as the fruit is set, by means of a spraying apparatus for the sake of economy.

Victoria Plum Leaves Glaucous (Loughgall).—The leaves are affected by what is known as "silver leaf," which is probably caused by a fungus, but no satisfactory reason has yet been given for the affection. The twigs are overgrown with moss, and altogether in a bad state of health. The fungus sometimes affects the fruits, giving rise to what are known as "bladder Plums," but it also attacks the Sloe and Bird Cherry. It would be advisable to spray the trees with Bordeaux mixture at half strength, and afford a top-dressing of some approved fertiliser, so as to promote better health in the trees, applying it from the stem outwards to a foot beyond the spread of the branches.

Chemical Composition of Kainit (H. J. E.).—The following is a good average analysis:—

Moisture	12.70
*Sulphate of potash	23.60
Sulphate of magnesia	14.50
Chloride of magnesium	12.40
Chloride of sodium	34.60
Sulphate of lime	1.70
Insoluble matter	0.50

100.00

*Equal to pure potash ... 12.80

The article was first used in Germany, but we do not know at exactly what time.

Vine Unsatisfactory (Prior).—We can only suggest selecting the best of the three growths now starting, and removing the others. The Vine will probably make a good cane this summer, but a pailful of blood applied raw to the soil was not good practice. It ought to have been mixed with soil and the powdered mortar before applying, allowing to lie for at least three or four months, and then be placed on the surface of the border, and lightly pointed in without disturbing the roots of the Vine. The other substances would not do any harm, but good, though we consider you are overfeeding. If the Vine has not been overdone in that respect, and other conditions are favourable, we do not see why there should not be a good growth this summer. Better leave it alone as regards manure for a considerable time, for what you are doing or have done is anything but favourable.

Fungus on Chrysanthemum Leaves (J. F. S.).—No, there is no "rust," but a fungus which causes the yellowness and afterwards browning of the leaves, which wither and die. The parasite is called *Septoria chrysanthemi*, which chiefly attacks young plants and the cuttings, and is frequently accompanied by eelworm, but we did not find any in your case. The fungus is wholly internal, therefore not readily reached by an external application, but the disease has been prevented spreading by spraying with diluted Bordeaux mixture, and dusting with the advertised preparations of sulphate of copper, such as anti-blight and fostite. The precaution should be taken to select cuttings from perfectly healthy plants, not to keep them too close, and avoid very rich soil. The procedure you have followed—namely, "picked off all leaves which are as bad as the loose ones" sent us, "and dipped the plants in Kilmright, 2 ozs. to 1 gallon of water," is the correct one. Give the plants all the light and air possible, then they will, with the treatment, grow out of the disease.

Names of Plants.—We only undertake to name *species* of cultivated plants, not wild flowers, or varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in securely tied firm boxes. Thin paper boxes arrive in a flattened state. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool or paper the worst. Those arrive in the best condition that are so closely or firmly packed in soft green fresh grass, as to remain unmoved by shaking. No specimens should be sent to rest in the post office over Sunday, on which day there is no delivery of postal matter in London. Specimens in partially filled boxes are invariably injured or spoiled by being dashed to and fro in transit. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (A. A. T.).—*Crataegus mollis*. (Condy).—1, *Akebia quinata*; 2, *Holboellia* (*Stauntonia*) *latifolia*. (H. J. J.).—1, *Centranthus macrosiphon*; 2, *Cheiranthus alpinus*. (E. B.).—*Saxifraga granulata*. (R. G.).—*Hamamelis japonica*, the Japanese Witch Hazel.

TOMATO WINTER BEAUTY.—We are informed that the entire stock of Mr. Mortimer's new Tomato, Winter Beauty, which was exhibited at the R.H.S. meetings at the Drill Hall, on April 18th and May 2nd, and received the Society's award of merit on the former date, has passed into the hands of Messrs. Sutton & Sons, of Reading, who will distribute it next season. This variety was figured on page 387 of our issue of May 11th.

Bedding out plants in variety from 3s. doz.

STUD BABIES.

Poor little things! what an anxiety they are—not to their parents, for their father they never know, and their mothers have no idea of their monetary value, and less idea of the risks they run. Only one foal in a twelvemonth, and the breeding days of a mare are not for ever.

Living as we do next door to a rather important Shire horse stud, and holding the owner in great esteem, we have seen much of the pleasures and anxieties that beset the springtime of the year. Two or three mares are expected to foal. There is a certain air of excitement about the stables, and more than an air of excitement in the head man's manner. Poor fellow! his responsibilities are weighty; practically he is in sole charge of most valuable property; a few minutes' neglect, a little impromptitude in action, and a valuable life is sacrificed, or the long-expected foal comes to an untimely end.

In our country neighbourhood, as in many more, it is a matter of six or seven miles before a decent veterinary surgeon can be reached, and then the chances are he is not at home. Privately we have more faith in the prompt attention of a man who has been brought up in the stables to the more skilled, but often delayed, services of the "vet." One would suppose a carthorse foal was of so stalwart a nature that little would affect it, but somehow or other, if we have a particularly well-bred foal, it seems surrounded by pitfalls from its birth to the time when it is fairly yoked, and takes its place and does its share of farm work.

That many of the risks are preventible we feel sure; perhaps we are ourselves to blame in a measure for the delicacy of our young stock by our persistent high breeding and our system of forcing for early maturity. Competition is so strong, we have "assisted" Nature too much, so she takes her revenge.

We can hardly imagine our skin-clad, woad-painted ancestors as liable to nervous disorders—indigestion, gout, and stomachic troubles—they are the outcome of ultra-civilisation, and the same applies to our stock. We may have symmetry of shape and form, but we have to pay for it sooner or later.

Let us imagine the longed for foal safely arrives. There must not be long delay ere a meal is served, and that meal its mother's milk. There are cases, indeed, when the poor foal is an orphan, and no foster-mother at hand. Then it becomes necessary to make a "bottle baby," and the attendant may consider his hands full for some days to come. We prefer to get a bottle with a proper india-rubber teat, but a quill wrapped round with worsted and thrust through a cork into a pint bottle will make a good substitute; but absolute cleanliness must be insisted on, or without any doubt the wretched little animal will be seized with diarrhoea, and our experience tells us for that there is little or no hope of cure for one so small. At first the feeding must take place every half-hour, and remember this must be night work too. There must be no shirking. A knowing man will soon be able to see when he may lengthen out the intervals between meals.

Cow's milk differs in some essentials from that of the mare, so cow's milk must be treated with a little water to reduce the caseine and fat, and with a little sugar to make it as naturally sweet as the mare's milk is. The proportion of water may appear large, but the young stomach is delicate, and over-richness in the diet would be fatal. One part water to two parts milk at first will be a suitable proportion, then one-fourth of water as the foal grows stronger.

See that the milk is freshly taken from the cow into a warmed vessel. Its own mother would provide it with warm milk. We have to take the place of the mother. Possibly few amateurs will believe what difference there is in milk. If it is possible to get a choice, take the milk of a young freshly calved cow in preference to one that is past her best. Were the foal fed naturally the fresh milk drawn from its mother would act as a laxative on the bowels; failing this a gentle enema of tepid water and a little glycerine would be equally effective.

We prefer this means to a dose of castor oil. It is the bowel that requires to be emptied, not the stomach (we might remark that an enema should find a place in every stable; many a valuable life may be saved thereby). If castor oil is given the dose must be small.

Early foals, that is foals born before their mothers have had access to green food, are more liable to obstinate constipation than those born later, when there is a full bite of grass. By the time the foal is two hours old, the bowels should have been relieved. If this is not the case help must be given. Try the enema first, and failing any activity then proceed with the oil. Should the oil not be effectual, send at once for the vet, as the case is beyond the power of the amateur.

We have got away from the subject of the first meal. Most foals, if strong and lively, will find their own way to the teat; but of course there are cases where the foal is backward at looking after its own interests. The attendant must be on the alert. If the teat be rubbed with a little milk the smell will usually attract the hungry

youngster. It should be watched for a few minutes to see whether it really is getting a meal. There are cases where the milk does not easily flow from the teat, or, indeed, where it will not come down at all. It is the worst of folly leaving these little details unattended to till the poor foal is getting hungrier and weaker every moment. Very little delay and the foal will be past recovery. Hence we see the necessity for having a really good man who thoroughly understands his business and the manifold requirements of young stock.

We find we have hardly got the foal more than a step or two on its life journey. There are several other points of great importance we would refer to, but they must stand over for a time.

WORK ON THE HOME FARM.

Farmers are never satisfied, and if they were the great British public would not be pleased, for it would not consider its farmer a true John Bull if he could find nothing to grumble about.

The agriculturist who complains of the present weather we should hardly blame, for the continuous rains must be very trying to the man who has a large acreage of land to prepare for Turnips and not too much time wherein to do the work.

We have spoken to several farmers this week and only one appears to be satisfied with the weather, and he is more of a stockowner or English rancher than an ordinary farmer, as we understand the term.

As a fact little work of any kind has been done. Wheat is partly hoed, or rather looked over, for few farmers do more than look over their Wheat nowadays. Barley and Oats, although both are backward, require the weeds removing from them. This must be done as soon as possible, but hands are very scarce and hardly to be had. The women of the village who used to be glad to earn a few shillings by wielding the hoe, now would scorn to do anything of the kind, and although one or two exceptions might be found, even these would decline to face the young corn with rain or even a heavy dew upon it. So the work has to be left undone or rushed over in a slipshod way.

Wherever we go we see ewes that have been through the washdyke but have seen none clipped. There has been no drying weather, and it is hardly warm enough yet, though June is very near.

We again hear of serious losses amongst young calves. They die from the effects of grey scour when they are two or three days old. This should be preventible. The complaint generally arises from indigestion through having too much milk irregularly. A newly born calf must have a strictly limited allowance of milk, but if scour does commence, give a couple of raw eggs and a dose of cholera mixture, and follow these by a dose of castor oil. We ourselves had heavy losses until we used these remedies, which have been entirely successful, but as we have intimated above, prevention is better than cure and much cheaper.

REMARKS.

14th.—Overcast day, dull at times; spots of rain at 2.30 P.M., gradually increasing to showers.

15th.—Steady rain from 5 A.M. to 10 A.M., then clearing and sunny afternoon.

16th.—Showers in small hours; bright breezy morning. Thunder and lightning at 1.40 P.M., heavy rain from 2 to 3.30 P.M., and showers later.

17th.—Gale and showers in small hours; windy and generally sunny day; cloudy evening.

18th.—Cloudy early; bright day; spots of rain at 4.30 P.M. and a shower at 5 P.M.

19th.—Fine, but little bright sunshine; slight showers at 4.30 P.M. and in the evening.

20th.—Gleams of sun early; showery morning and a storm rain at 11 A.M.; overcast after noon.

A wet week, with uniform but somewhat higher temperatures.—G. J. SYMONS.

DAHLIAS! DAHLIAS!!

Ware's

UNRIVALLED COLLECTION

We are now Booking Orders for Immediate Delivery.

Special attention is drawn to the two following beautiful
NEW CACTUS VARIETIES for 1899.

Early Orders are solicited as the stock is limited.

E. O. GREENING.—Purple, shaded crimson, medium sized flowers, long and twisted petals; very free flowering; 2½ to 3 feet high. 5/- each.

SYLVIA.—Silvery-lilac shaded rose, splendid shade of colour, wonderfully free blooming, a splendid flower for cutting, lasting very long when cut; flower stem long and stiff; 4 feet in height. 5/- each.

NEW CACTUS DAHLIAS, Vars. of 1898.

Including such sorts as:—ARACHNE, CAPSTAN, FALKA, ISLAND QUEEN, LAVERSTOCK BEAUTY, RUBY, &c. 2/- each

CACTUS DAHLIAS, General Collection.

All the leading varieties. Our selection, 5/- doz.

SINGLE CACTUS DAHLIAS (New Type).

Our selection, 5/- per dozen.

DAHLIAS.—Singles, Pompons, Shows, and Fancies, in great variety. Our selection, 5/- per dozen.

BEGONIAS.

WARE'S GOLD MEDAL and 1st PRIZE STRAIN.
(If required started into growth, an intimation should be given to this effect).

Single—Mixed, 3/- per doz.; 20/- per 100.

„ To colour, 5/- doz.; 32/- per 100.

„ Extra choice, for Conservatory or Exhibition, 9/- and 12/- per doz.; 65/- and 75/- per 100.

„ Named sorts, splendid forms and colours, from 1/6 each.

Double—Mixed, 5/- per doz.; 35/- per 100.

„ To colour, 8/- and 10/- per doz.; 60/- and 80/- 100.

„ Gems for Exhibition, 18/- and 24/- per doz.

„ To name, THE FINEST EVER OFFERED, from 36/- per doz.

DAHLIA CATALOGUE, containing Illustrations of many new sorts, and list of varieties with full descriptions, post free upon application.

N.B.—All Orders amounting to 20/- and upwards when accompanied by cash, are sent Carriage and Packing free.

“SUNPROOF” Shading.

An entirely new Glasshouse Shading, sold in 6d. 1lb. tins, to be washed on the glass with cold water, as if it were soap. Guaranteed to be one-half the price, and to be the only shading in a solid state ready for use without the waste of time and material in being prepared, and to be superior to any other shading. Try it for yourself, and if not entirely satisfactory your money will be returned.

S.M. TREE FASTENERS.—The cheapest and best method of fastening plants and trees to walls. Being made of pure soft lead and not fixed to the nails (like patent wall nails, which when the nails get broken the article is useless), they may be used with ordinary nails for a lifetime. Under 2d. per dozen.

S.M. CLIPS.—To be used in the place of raffia, &c., for tying all plants to stakes, &c. Fastens instantly, and is everlasting, so saves time, trouble, and expense. 1d. doz.

FLOWER GRIP HOLDERS.—The only self-making buttonhole, watertight flower-holder ever invented, and the best for show and other purposes. Price 6d.; ladies', 9d.

IVORINE PLANT LABELS of every Description, guaranteed the cheapest Imperishable Labels, and the wording legible and permanent. Samples free.

WATERPROOF INK, for writing on all kinds of Labels, whether wood or metal. The only ink to stand the outside weather. Price 7d. Bottle.

GARDENER'S FOUNTAIN PEN, filled with the waterproof ink, 1/-.

Send for Illustrated List, with samples, for further particulars and other articles of the

THE TEMPLE SHOW.

FOR the twelfth consecutive time the Temple Gardens have become the resort of horticulturists and the scene of their praiseworthy productions. Each year since the establishment of the exhibition it has grown in popularity, until it is now visited by a great multitude of persons interested in gardening, and has become one of the society functions of the year. In the acquirement of such a position for its annual display, the Royal Horticultural Society has cause for congratulation, and it cannot be doubted for a moment that the gatherings have done much to widen and deepen the love for gardens and gardening, and have thus served the purpose for which the rich and varied displays were inaugurated.

The Show now being held proves to demonstration that owners and growers of choice and rare plants and flowers, as well as of other products, are as anxious as ever to send the best evidences of their skill for the delectation of the thousands of visitors. The results of months of incessant attention are to be seen in the several marquees, and everyone will agree that such magnificent collections of plants and flowers could not be brought together under similar conditions elsewhere in this country. For it must be borne in mind that no money prizes are given, and it cannot therefore be said that the great patrons of horticulture and their gardeners who are staging so creditably are doing otherwise than laudably uniting to maintain the supremacy of British gardening.

Inexperienced visitors and casual observers may think that it is the work of a few days, or at most weeks, to make all the preparations that are necessary for this event. But this is not so. Careful study must be brought to bear months before by officials, and we know at least one gardener who has decided upon his exhibit for 1900, and is in fact already preparing his plants for that occasion. He has therefore to look forward to twelve months of thoughtful labour, and it will be a labour of love. The credit of the garden in his charge will be maintained; while the Royal Horticultural Society is strengthened by the strenuous efforts

of such men. There are happily many among the gardeners of England who are equally ready to respond to the call of duty, and with no thought for their own enrichment.

It has also to be noted that the great industry of horticulture is always splendidly represented at the Temple Shows. Plants from leading firms are seen, remarkable for their rarity, or for consummate skill displayed in their culture, and in having them in the best possible condition at the appointed time. Flowers in infinite variety are temptingly displayed, while early fruits and vegetables of unsurpassable quality for the season command general admiration.

But besides the organisers of the show and those who produce and arrange the collections that make the spectacle so delightful, there are others who must be accorded well merited recognition. These are the Benchers of the Inner Temple, who place their park-like gardens at the disposal of the Society, and there is no exaggeration in saying that, all things considered, there is no available place in the metropolis better fitted for the purpose. The gardens are readily accessible from all parts, and their situation is so well known that no one in London can have any difficulty in reaching his destination. The splendid lawns, the stately trees, the handsome buildings, and London's noblest boulevard all tend to increase the pleasure of a visit to the gardens at show time, when they pass for the nonce from the Temple of Law to the infinitely more beautiful Temple of Flowers.

The popularity of this first great summer show of the season increases year by year, and on this occasion the resources of the managers were taxed to the utmost to find room for the arrangement of the exhibits within the area at disposal, and if space were unlimited the Temple Shows of the R.H.S. would, large as they are, soon become as large again.

By the enterprise and skill of our leading professionals, the most noteworthy plants and beautiful flowers are brought together in superb condition; while the earliest and best of fruits and vegetables are not less meritoriously displayed in the Temple Gardens. There is, in fact, an exceptionally high average of excellence pervading the gathering, and it is, fortunately, seldom that mediocrity is descended to. Whether we look to the Orchid or the Rose sections, to the hardy flowers or the greenhouse and stove plants, to the fruits or the vegetables, we find the same evidences of cultural skill, judgment in selection, and taste in arrangement. The exhibition that opens to-day (Wednesday), and continues until Friday evening, is one of the grandest that it has been our lot to see, and we are confident that it will give pleasure to thousands of visitors.

On a previous occasion we have given the dimensions of the space in each of the five marquees, and as they remain the same year by year the necessity for doing so again is removed. Suffice it to say that vast as is the amount of tabling at command it would require to be enlarged almost thrice ere sufficient room could be found to meet all demands in full. This season the number of entries has increased very materially, and every individual applicant has had to be content with a reduction of upwards of 50 per cent. from the space for which he sought. This will convey to readers an idea of what dimensions the Temple Show would attain to if the amount of ground at the disposal of the Royal Horticultural Society were unlimited. It serves also to illustrate what an immense amount of work devolves on the officials in allocating the space so as to do justice to all exhibitors and to the public. We are glad to be able to say, ere commencing the detailed report, that the weather on Wednesday morning was bright and warm enough to bring forth visitors in their thousands.

ORCHIDS.

If the displays at the Temple Gardens are celebrated particularly for one section, pride of place must be accorded to the Orchids, which are unique for diversity, quality and quantity. Each year sees a magnificent collection contributed by professional and amateur growers, and the show that is now being held proves no exception to the general rule. True, we miss one or two names that spell super-excellence, but there are others who, if smaller, show in a manner that is creditable alike to themselves and to the Society they support. The whole of the central staging of the large tent is devoted to Orchidaceous plants, and the effect produced is brilliantly beautiful. Then in the next marquee we find other contributors, swelling the numbers and the quality of this portion of the exhibition. Not only do we see new hybrids and varieties, but the older and more familiar kinds are there in the best possible condition that can be attained to by excellent methods of culture.

The most prominent position has been secured by Messrs. B. S. Williams & Son, Upper Holloway, and it must be admitted that they have made admirable use of the space at their disposal. This firm almost invariably makes skilful use of Ferns and Palms, which interspersed amidst the Orchids certainly enhance the general effect. This is done at the Temple as usual. The Orchids comprise in the main species, hybrids, and varieties that are known to most orchidists, and all show good culture and capital judgment in staging. We observed as amongst the most conspicuous a handsome centre plant of *Cymbidium Lowianum*, flanked and taced with *Lælia purpurata* in variety, *Cattleya Mendeli*, *Odontoglossum crispum*, *O. excellens*, with several *Cypripediums*, *Oncidiums*, and *Dendrobiums*. The two plants of *Richardia Elliottiana*, for which space was found, were of rich colour in the spathe, and clean in the leafage.

For the first time the comparatively young firm of Messrs. Stanley, Mobbs, & Ashtor, Southgate, is represented, and they have well done their share towards the show. The group is of good size, and contains many Orchids of beauty and quality. Their flowers, borne on healthy plants, are rich in colour, heavy in substance, and fine in form. We have not space to individualise very much, so must be content with special mention of *Lælia purpurata*, *L. tenebrosa*, *Cattleya Mossiæ*, *C. M. Mrs. C. H. Feiling*, *C. Mendeli*, *Cypripedium Martensianum*, *C. grande atratum*, *Odontoglossum Andersonianum*, *O. crispum* in variety, *O. citrosum*, *Cymbidium Lowianum*, *Oncidium varicosum*, *Dendrobium Dearei*, *Epidendrum hastatum*, and others. This firm enhance the beauty of the group by two cork arrangements of *Odontoglossum crispum* and *Miltonia vexillaria* in variety. A white *Lælia purpurata*, named *Ashtonæ*, is a novelty.

Superb indeed are the many types of *Lælia purpurata* in the collection of Orchids contributed by the renowned Mr. J. Cypher, of Cheltenham, of whom we do not see nearly enough in London. As examples of culture these plants could scarcely be excelled, and the encomiums lavished upon them by visitors were thoroughly deserved. Not that these are the only Orchids utilised. There are many others of equal merit, and they include *Oncidiums sarcodes*, *varicosum* and *concolor*, *Cattleyas Warneri*, *Mossiæ*, *M. splendens*, and *M. grandiflora*, *Odontoglossums crispum* in variety, *Peseatorei*, and *luteo-purpureum*. Then there are *Lælia tenebrosa*, *Dendrobium Jamesianum*, *nobile magnificum*, and *thyrsiflorum*, *Miltonia Roezli*, *Cattleya citrina*, and many others of equal merit.

Yorkshire does not send us many Orchids, but those that come from Messrs. Charlesworth & Co., Heaton, Bradford, are always welcome, as they show us that the county of broad acres is equal to the call when required. The firm had a fair amount of tabling to occupy, and it is occupied well with a profusion of fine varieties of *Odontoglossum crispum*, *Miltonia vexillaria*, *Lælia purpurata*, *L. p. Russelliana*, *L. p. fulgens*; grand plants of *Cymbidium Lowianum*, *Cattleya Bowringiana*, *Odontoglossum Halli*, a few *Cypripediums*, *Dendrobium atro-violaceum*, *Cattleya Schilleriana*, *Lælia flava*, with others equally well known that we need not particularise.

Since Messrs. H. Low & Co. have become settled at Bush Hill Park, Enfield, they have been able to stage from their splendid collection of Orchids in excellent form. The plants evidently have all their requirements catered for, and are living examples of the treatment they receive being suitable. The growths are robust and the leaves glow with health and cleanliness. The firm's plants rise from a groundwork of *Asparagus*, which admirably serves its purpose in throwing into bold relief the handsome Orchids. Of these *Lælia purpurata*, *Cattleya Mossiæ*, *C. Mendeli*, *Dendrobium Bensoniæ*, *Odontoglossum crispum*, *Lælia tenebrosa*, *Oncidium concolor*, *Dendrobium Falconeri*, with a number of *Cypripediums* are prominent. *C. M. Bush Hill Beauty* is very handsome, and is quite distinct from existing varieties.

We should hardly recognise the Orchid department of the Temple Show if Sir Trevor Lawrence's plants were absent. Fortunately, however, such a contingency is scarcely likely to arise, as Mr. W. H. White, Sir Trevor's grower at Burford Lodge, is ever ready to do his part in maintaining the exhibition. Many of the Burford Lodge plants are such as are not commonly seen, even by orchidists, as they come within the category of botanical curiosities, and this makes the exhibit still more interesting. It is probable that from the time the Show opens until it closes there are persons examining and admiring the plants in the group from the President's gardens. Particularly attractive among the showier members of the group are *Vanda teres*, *Thunia Marshalliana*, *Miltonia vexillaria*, *Thunia Bensoniæ*, *Cattleya Mossiæ*, *Odontoglossum crispum* in splendid variety, *O. Pescatorei*, *Oncidium concolor*, *Masdevallia Mundyana*, *Cypripedium barbatum*, *Lælio-Cattleya Canhamiana*, *Lælia purpurata*, *Cattleya Mossiæ Wagneri*, *Cattleya Mendeli*, *Masdevallia Harryana miniata*, *Cattleya Mossiæ Grosseniana*, *Odontoglossum luteo-purpureum hystrix*, *Cypripedium Eleanor*, *C. Lawrenceanum*, *C. glanduliferum*, *C. Hookeræ voluteum*, *Phalænopsis amabilis*, *Epiphronitis Veitchi*, *Lælio-Cattleya eximia*, and others. Of botanical Orchids we may note *Masdevallia Gelseniana*, *caudata-Estradæ*, *Saccolabium gemmatum*, *Bulbophyllum elegans*, *Campanumæa uliginosa*, *Ornithocephalus grandiflorus*, *Polystachya bracteosa*, *Stelis species*, *Restrepia trichoglossa*, *Restrepia species*, *Saccolabium miniatum*, and *Polystachya Zambesiaca*.

As an amateur enthusiast in Orchid culture, especially *Odontoglossums*, Mr. W. Thompson, Walton Grange, Stone, Staffs, must take a high position, and Mr. W. Stevens, his gardener, manages the plants with the knowledge derived from ripe experience of their likes and dislikes. On this occasion the plants of *Odontoglossum luteo-purpureum*, with an immense spike, *O. crispum Arthur*, *O. triumphans hybrid King Alfred*, *O. crispum Arthur Brisco*, *O. Coradinei Roehelini*, *O. crispum Prince Charming*, *O. Andersonianum alba maculosum*, *O. Pescatorei*, *O. Wilekeanum Lowi*, with others, the whole having superbly flowered *Cochlidia Noezliana* in the foreground, are a great credit to both owner and grower.

With an ability for growing Orchids well Mr. W. H. Young, Orchid grower to Sir Frederic Wigan, Bart., Clare Lawn, East Sheen, combines skill in arrangement, with the natural result that the Clare Lawn group is always attractive. The plants of *Dendrobium thyrsiflorum*, *Lælia purpurata*, *Cymbidium Lowianum*, *Cypripedium callosum Sanderæ* (fig. 99), *Staurosis gigantea*, *Cypripedium Lawrenceanum*, *Cattleya Louryana*, *Miltonia Roezli*, *Odontoglossum crispum* in variety, *O. Ruckerianum*, *O. Pescatorei*, *Cattleya Skinneri alba*, *Thunia alba*, *Cattleya superba splendens*, *Masdevallia Lindeni*, *M. Harryana*, *Cœlogyne Schilleriana*, *Odontoglossum excellens*, *Cymbidium Devonianum*, *Trichopilia*

tortilis, *Cypripediums* W. H. Young, with *Godefroyæ* and *bellatulum album*, are splendid.

The only Orchid exhibitor from Hampshire at the Temple this year is Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak, Bishopstoke, who has arranged a capital group occupying a fair amount of space. The stand is bright with flowers of excellent quality and well diversified. The plants are healthy and clean, and comprised *Cattleyas*, *Dendrobiums*, *Odontoglossums*, *Cypripediums*, *Oncidiums*, *Lælas*, and a few others. Though rather flat the collection produced a good effect.

The small exhibit of Orchids contributed by Mr. W. Buckie, gardener to M. S. Cooke, Esq., Tankerville, Kingsdon Hill, is bright and attractive. *Masdevallia Harryana* are excellent, as are *Lælia purpurata*, *Odontoglossum crispum* in variety, *Miltonia vexillaria*, *Odontoglossum cirrhosum*, *Cattleya Mossiæ*, and others.

Mr. Lupton, gardener to J. Rutherford, Esq., Blackburn, Lancs, stages Orchids occasionally at the Drill Hall, but so far as we can recollect this is his initial visit to the Temple. His plants mainly comprise *Cattleya Mossiæ* in variety, all splendidly grown. *Cattleya Ruth* and *C. Mossiæ* John Shulz were particularly striking.

There are several amateur Orchid growers in the northern suburbs of the metropolis, and on the present occasion they are represented by Mr. G. Cragg, gardener to W. C. Walker, Esq., Percy Lodge, Winchmore Hill. His collection of well grown Orchids, rising from a groundwork of Ferns, small-leaved *Caladiums*, and *Asparagus* looks handsome, especially as the stager had exercised some considerable taste in arranging the plants. *Brassia verrucosa*, *Lælia purpurata*, *Cattleya Skinneri*, *Oncidium Marshallianum* superbum, *Dendrobium Bensoniæ*, *Odontoglossum crispum*, *O. Pescatorei*, *Oncidium concolor*, *Cattleya citrina*, *C. Acklandæ*, *Cypripedium Lawrenceanum*, and *Lycaste cochleatum* are all well shown.

Messrs. J. Backhouse & Son, Ltd., York, seldom find their way to London, but when they do send exhibits these are well worth the seeing. Their group in the Orchid tent is splendidly arranged, and in containing various plants gains distinctly in effect. The Orchids include *Cypripediums*, *Odontoglossums*, *Lælias*, *Cattleyas*, *Oncidiums*, *Dendrobiums*, and *Sobralias*, with Ferns, *Asparagus*, Palms, small *Crotons*, *Dracæna Sanderiana*, and others. Two black cases by their formality somewhat marred the effect.

Though Messrs. F. Sander & Co., St. Albans, pass from the large marquee to the smaller one they lose nothing in the moving. The St. Albans Orchids are of such excellence that a mere question of position does not minimise the importance of the exhibit in the slightest degree. The plants bear the impress of health in the leaves and in the flowers, and everyone interested in Orchids must spend some time at the group. They occupy a considerable length of tabling with a diversified selection of plants that will maintain the firm's high reputation. It is pleasant to see that some taste has been displayed in arrangement. Where there is so much of excellent quality it is difficult to select, but we may note *Cypripedium Exul*, *Cattleya Mossiæ*, *C. Lawrenceanum*, *Lælia purpurata*, *Cypripedium callosum* Sanderæ, *C. conco-bellatulum*, *Lycaste Mooreana*, *Thunia Marshalliana*, *Odontoglossum ramosissimum*, *Masdevallia Veitchi*, *Dendrobium atro-violaceum*, *Sophrolælia Marriottiana*, *Odontoglossum crispum* in charming variety, *Cœlogyne Dayana* in superb form, *Bulbophyllum barbigerum*, *Miltonia vexillaria* in variety, with others.

Attractively beautiful are the *Miltonias* that have been sent to the Temple from Belgium by Mons. Lucien Linden of Brussels. The colours cover a wide range, and are singularly pure in tone. There are white varieties and all intermediate shades through rose to purplish-rose. *Jupiter*, *Fernande*, *Nelly*, *La Rose*, *marginata*, and *delicatesse* are particularly striking. In addition to these there are several *Odontoglossums* of more than average beauty.

A small group of Orchids is contributed by Mr. J. Clarke, gardener to Ludwig Mond, Esq., Avenue Road, Regent's Park. The plants are well grown, and carry flowers of capital quality, but the arrangement left much to be desired. The kinds included *Cymbidium Lowianum*, *Dendrobiums thyrsoflorum* and *densiflorum*, *Odontoglossums crispum* and *citrosum*, with *Cœlogyne pandurata*, *Cattleyas Mendeli* and *Mossiæ* in variety.

ROSES.

The collections of Roses are always a great feature, and this season's exhibits fully maintain the high standard that has been reached on previous occasions. Not only are the collections complete, but displayed in an artistic manner. The now popular *Crimson Rambler* plays an important part in almost every exhibit, and lends itself readily in relieving the density of many of the other plants. The exhibits are staged or grouped in different parts of the tents, and although many similar varieties are met with in each exhibit, yet there are fresh and new features in all of them; and it is doubtful if a better display of Roses has ever been shown at the Temple than are there this season.

Messrs. Paul & Son, Cheshunt, occupy the same corner in the large tent that they have occupied in former years. The whole exhibit is remarkable for its freshness and admirable grouping. The chief varieties employed, as standards and trained plants, are *Crimson Rambler*, *Clara Watson*, *La France*, *Margaret Dickson*, *White Baroness*, *Rev. Alan Cheales*, a good new Rose sent out by the firm. The *Carmine Pillar* is grand, containing perfect wreaths of flowers. The best varieties as seen in the bush plants are *Caroline Testout*, *Mrs. Paul*. The new *Psyche* is very prominent, as are *La France*, *Madame de Watteville*, and *William Warden*.

The exhibit of Roses by Mr. C. Turner, Slough, is, as usual, in first

rate condition and beautifully arranged, the group in fact is noteworthy for the taste displayed in arranging. Foremost must be mentioned the *Crimson Rambler* specimens, which had been utilised to hide the tent poles; this they did admirably, with the help of a few Palms and Bamboos. The Roses are in capital condition, especially *Mrs. J. Laing*, *Juno*, *Ulrich Brunner*, *La France*, *Madame Victor Verdier*, *Caroline Testout*, *Souvenir de M. Eugène Verdier*, *Perle d'Or*, and *Madame A. Chatenay*. The group is edged with Ferns, making a good foreground.

The celebrated firm of Messrs. Wm. Paul & Son, Waltham Cross, also have the same prominent position in the large tent they always occupy, and worthily too, for the exhibit on this occasion surpasses all previous exhibits even at the Temple Show. Although the space is utilised to the fullest extent, there is no suspicion of overcrowding, the standard trees in pots carrying off the stiffness so common in Rose exhibits. The new climbing *Mrs. W. J. Grant* came in for a good share of attention, as did the new hybrid Tea *Tennyson*, a capital seedling from *White Lady*, of beautiful flesh colour. *Aurora*, *Marquis Litta*, *Mrs. Sharman Crawford*, *Ella Gordon*, *Enchantress*, *Spenser*, *Crimson Queen*, *Souvenir de President Carnot*, *Elise Fugier*, *Duke of York*, *Clio*, and *Mrs. John Laing* are very notable. The entire exhibit appears to be a forest of Roses.

Mr. W. Rumsey, Joynings Nursery, Waltham Cross, also adds to the display of the queen of flowers by an exhibit which occupies a large space in the centre of the tent. The specimen plants fully maintain Mr. Rumsey's reputation as a Rose grower. The boxes of cut blooms are the chief features of his exhibit, although plants are represented in many varieties. The *Maréchal Niels*, *Reine Marie Henriette*, *Mrs. J. Laing*, *The Queen*, and *Niphetos* are good, the whole being arranged with Ferns and Palms, giving it a pleasing effect.

The Canterbury Roses, now so justly celebrated from Mr. G. Mount, are well up to his usual standard. The blooms on long stems are always a feature of his displays, and such is the case on this occasion, the wood and foliage plainly testifying to the healthy vigorous state of his plants. *Crimson Rambler* Roses in pots, in company with *Acers*, formed an attractive background, while the cut flowers are deserving of all praise. *Maman Cochet*, *Mrs. John Laing*, *Prince Arthur*, *Général Jacqueminot*, *Anna Ollivier*, *Ulrich Brunner*, *Niphetos*, *Captain Hayward*, *Bridesmaid*, *Mrs. W. J. Grant* (grand), *Catherine Mermet*, *Comte Liabaud*, and *Baroness Rothschild*. This exhibit constitutes one of the finest exhibits of cut Roses ever seen in the Temple, and it is doubtful if Mr. Mount has ever made such an effective display before.

Mr. G. W. Piper, Uckfield, Sussex, again stages his new Rose, *Sunrise*, in excellent form. The buds, combined with the coppery foliage, have quite an artistic appearance; it is a Rose that will be much sought after when it becomes known. Mr. J. Russell, Richmond, exhibited a bank of Rose growing in 5-inch pots, which are very attractive from a decorator's point of view. The best forms are *La France*, *Mrs. J. Laing*, *Ulrich Brunner*, *Captain Christy*, and *Baroness Rothschild*.

PLANTS AND FLOWERS.

It is only on occasions like the Temple Show that the plant lover can see such remarkable collections. The variety is bewildering. Here we have a group of specimen *Caladiums*, next the eye rests on a collection of *Clematises* trained and covered with their large showy flowers; then, again, we see the groups of rich *Rhododendrons*, *Begonias*, herbaceous plants in great variety, hardy cut flowers, and so on through each tent. The restrictions placed on the space of the exhibitors have undoubtedly prevented the repetition of exhibits, for each exhibitor endeavours to produce something that will mark him from his compeers.

Immediately on the left on entering the large marquee the exhibit of Messrs. G. Jackman & Sons, Woking, calls for attention, for the firm this year has grouped a collection of *Clematis coccinea* hybrids. The plants are large, trained in balloon shape, with good healthy foliage and plenty of flowers; the exhibit is attractively displayed with foliage plants and Ferns. *Duchess of York*, a pale flesh colour; *Duchess of Albany*, *Admiration*, *Countess of Onslow*, and *Grace Darling* are conspicuous for their distinct colours and free-flowering propensity.

A fine collection of Palms and decorative plants is exhibited by Mr. W. Iceton, Putney. The Palms are the picture of health, and well developed; indeed the names of *Iceton* and Palms are inseparable. The remainder of the exhibit is composed of large *Araucaria excelsa*, *Japanese Maples*, *Caladiums*, *Dracænas*, *Lilium Harrisii*, beautiful *Heaths*, *Hydrangeas*, and *Lily of the Valley*, forming a very interesting display.

The gorgeous *Rhododendrons* from Mr. J. Waterer, Bagshot, claimed much attention from the visitors; they form such a pleasing contrast to the aristocratic Orchids and delicate *Caladiums* that one could almost fancy oneself in Hyde Park. The standards and bushes have been timed for the show almost to a day, and are a credit to the growers. Such varieties as *Duchess of Connaught*, *Cynthia*, *Gomer Waterer*, *Mrs. J. Kelk*, *Pink Pearl*, *Sappho*, *Mrs. Tom Agnew*, *Francis B. Hayes*, and *John Waterer* will convey some idea of the excellent quality.

Again Messrs. Smith & Co., Worcester, demonstrate the fact that *Clematises* can and should be grown for early summer decoration; their specimen plants in the past are well known to the horticultural world, and on this occasion the firm contributes another display that calls for admiration from all beholders, whether from a grower's point of view or from the ordinary flower lover. The chief forms are *Belle of Woking*, *Lawsoniana*, *Mrs. G. Jackman* with its pure white flowers, *Excelsior*, *Lady Caroline Nevill*, *Marie Lefebvre*, snow white *Jackmanni*, *Countess of Lovelace*, and *Madame Edouard Andrieu*.

The West End firm of Wills & Segar, South Kensington, so noted as decorators, arrange a choice collection of plants, such as giant Palms, which form an excellent background to a remarkable group of choice

foliage plants; every plant can be clearly seen, though at the same time the groundwork is well filled in. The most noticeable subjects are *Aloeasia argyrea*, a fine specimen, *Dracenas Godseffiana* and *Goldiana*, with perfect plants of *Nidularium fulgens*, *Phrynium variegatum*, and a number of *Anthuriums*, *Marantas*, *Begonias*, and such plants. A pleasing edging was formed with dwarf growing plants.

A splendid collection of *Caladiums* are grouped by Messrs. J. Laing and Sons, Forest Hill, and form a most imposing exhibit. The plants in all their varied tints are relieved by good specimens of *Cocos plumosus* as a background; needless to say, the specimens are in first rate condition, the leaves well developed and the colouring as it should be, bright and fresh, such varieties as *Alexander III.*, *Illustrious*, *Sir Julian Goldsmid*, *Golden Queen*, *Ladas*, *Rose Laing*, and *Gaspard Gruyer* form the chief features, while the little *C. argyrites* and *Maidenhair Fern* make a good front.

A gigantic exhibit of *Caladiums* is to be seen from Chelsea, and it is doubtful if Messrs. James Veitch & Sons have ever presented a better one to the annual frequenters of the Temple Show. The large plants with their perfect foliage, tastefully arranged with a groundwork of Ferns and Grasses, form an exhibit worthy in every way of the grower and exhibitors alike. The most conspicuous forms are *Marquis of Camden*, *Louis Van Houtte*, *Madame J. Box*, *Sir Henry Irving*, *Rose Laing*, *Baron A. de Rothschild*, *Madame Schmidt*, and *Gaston Chandon*. Every plant is well displayed, and the whole harmonises beautifully.

Messrs. Cutbush & Son, Highgate, worthily occupy a prominent position with a variety of plants, both flowering and foliage being well represented. A lofty background of Palms enables the smaller plants to be displayed to the best advantage. Conspicuous are a group of *Calla Elliottiana* with fine spathes of golden yellow. The *Malmaison Carnations* are also very attractive, as well as the decorative plants of *Crimson Rambler Rose*, hybrid *Azaleas mollis* and *rusticus*, and small plants of the *Otaheite Oranges* covered with fruit. Three large pyramids of *Carnations* in good varieties relieve the front of the group, while the *Malmaison Carnations* *Princess of Wales* form a beautiful groundwork, the groups of *Crimson Rambler Roses* and *Spiraea* are very effective. The whole is one of the finest features of the large tent.

Mr. C. Blick, gardener to Martin Smith, Esq., Hayes, Kent, stages a group of his well known *Carnations* in splendid style. The flowers are large and well coloured, while the foliage can only be classed as excellent. The chief varieties are *Churchwarden*, *Mrs. de Satge*, a large rosy red, and *Baldwin*, a monster Pink. The chief feature, however, of the exhibit is some excellent plants of a new yellow variety called *Cecilia*, a large flower, very pure in colour, and of good form. Other good varieties are *Morae Hutchinson*, *Mrs. Trelawney*, and *King Oscar*.

Messrs. Fisher, Son & Sibray, Ltd., Sheffield, occupy a space in the large tent with a group of plants arranged artistically. Its chief features are *Laelias purpurata Russelliana*, *L. purpurata alba*, *Cypripediums* in variety, *Anthuriums*, some well coloured *Crotons* such as *Delightful*, *Aigburth Gem*, *Rodeckianus*, *Miss Buister*, and *Golden King*, with Palms and a variety of other foliage plants, certainly a fine northern exhibit.

Mr. Chas. Turner, Slough, presents a group of well flowered *Azaleas*, that recalls the exhibitions of twenty years ago. The plants are well displayed in a bed of foliage plants and Ferns. *Charmer*, *Grandis*, *Roi Hollande*, *Duchesse de Nassau*, *Eggebrechti*, and *Mrs. Turner* form the chief varieties in the exhibit.

From Messrs. J. Veitch & Sons, Ltd., come a pretty and attractive group of hardy flowering and foliage shrubs, which seem very popular with the visitors. The hardy Bamboos and dark coloured *Acers* effectively screen the tent, and make a good background. The huge spikes of *Eremurus robustus*, *Elwesianus*, and *himalaicus* are conspicuous objects. The *Wistarias* also contribute an uncommon colour, while the standard forms of *Hydrangea paniculata grandiflora* are effective. The *Azalea mollis* and its hybrids also are bright, as are the plants of *Philadelphus Lemoinei*, *Boule d'Argent*, *Syringa*, *Madame Lemoine*, and the unique *Hydrangea Mariesi*, all being included in this attractive exhibit.

Messrs. J. Peed & Sons, Roupell Park Nurseries, Norwood, contribute to the *Caladium* exhibits by a group of large, well-grown specimen plants, which are remarkable for their freshness and bright colouring; chiefly to be noted are *fastuosum*, *Lady Mosley*, *Silver Cloud*, *Mrs. Harry Veitch*, *Duke of Teck*, *Mrs. W. E. Gladstone*, *Madame Mitjama*, *Oriflamme*, and *Michael Buchner*, an exhibit worthy of the position it filled.

Mr. Chapman, gardener to Captain Holford, Westonbirt, Tetbury, stages six of his hybrid *Hippeastrums*, which form a distinct feature at this late season. The variety *Desmond*, a white ground with rose markings, is very conspicuous; *Flying Fox*, a deep crimson, and *Trident* are also good.

Mr. G. J. Hunt, gardener to Pantia Ralli, Esq., Ashted Park, Epsom, contributes a display of well-grown *Caladiums*, interspersed with *Maidenhair Ferns*. His most notable specimens are *Sir Julian Goldsmid*, *B. S. Williams*, *Willfred Marshall*, and *Baron A. de Rothschild*.

Messrs. Sutton & Sons, Reading, stage an attractive exhibit of *Calceolarias*, comprising their strains of *Perfection*, *Spotted Mammoth*, and *Cloth of Gold*. The plants are dwarf and sturdy, while the individual blooms are very large, and the colours, markings, and shadings admirable. The *Nemesias* exhibited by the same firm attract a large amount of attention from the visitors. The new hybrids are a decided advance on the older type, inasmuch as they present a greater diversity of colouring, the blue form being quite a novelty. The older form of *N. strumosa Suttoni* is also well staged, the crimson and orange flowers being bright and attractive, a very appropriate method of popularising these annuals.

Mr. John Russell, Richmond, sends a display of hybrid *Azalea mollis* and *A. rusticus*. The well-known *Anthony Koster*, with its golden blossoms, *Byron*, *Daviesi*, *Edison*, and *Alma Tadema* are attractive, as are *Norma*, *Praxitele*, and *Emil Liebig*.

Messrs. W. Fromow & Son, Chiswick, have a pleasing change in a group of *Acers*, which are attractive and pleasing to the eye. The chief species and varieties are *A. palmatum crispum*, *p. reticulatum*, *laciniatum purpureum*, *dissectum ornatum*, *d. palmatifidum*, *sanguineum variegatum*, *sanguineum*, and many others. The plants are grown in small pots, and are admirable.

Messrs. T. Cripps & Son, Tunbridge Wells, who are noted for their ornamental foliage trees, grouped an excellent collection of *Acers*, beautifully arranged so as to form a good contrast in foliage in a tent where there is so much colour. These collections are most attractive.

The new and rare plants from Messrs. F. Sander & Co., St. Albans, contain many interesting and beautiful specimens. Perhaps the most attractive are the *Heliconia Sanderi*, a plant with beautiful variegated foliage; also a dwarf *Juniperus* named *Sanderi*. With these are the well known *Dracena Sanderiana* and *Carnations Ivanhoe*, *J. Coles*, and *Lily Measure*, all of the *Malmaison* type. From Mr. N. R. Hoffman, Thurlow Lodge, Thurlow Road, West Dulwich, comes a collection of *Caladiums*, all well grown, and tastefully arranged with *Maidenhair Fern*.

Messrs. T. S. Ware & Co., Tottenham, occupy a large space with a capital collection of single and double *Begonias*. The plants are dwarf and sturdy, and the blooms as large as one could desire, besides carrying a wealth of flowers very seldom seen on such plants; probably one of the finest exhibits of *Begonias* ever staged in the Temple Show or elsewhere. Those that are specially noteworthy are *Miss Mary Pope*, *Miss Bella Tait*, *Miss Alice Tait*, *Miss A. Beer*, *Prima Donna*, *Duke of Devonshire*, *Mr. R. Lawford*, *Lord Rosebery*, *Princess of Wales*, *Masterpiece*, *Her Majesty*, *Miss Barbara Ray*, and *Eclipse*. It would seem somewhat invidious to name more, but they really deserve it, and the grower should feel proud of his skill, as evinced at this exhibition, for it will do much to increase Messrs. Ware's prestige in this particular department.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, comes out in strong force with a display of *Begonias* that will add to his reputation as a grower and producer of a first-class strain. He is already noted for the able manner in which he arranges his exhibits, and on this occasion he has reason to be proud of his success. The single forms are exceptionally large with plenty of substance. The varieties that are most striking are *Admiration*, *Walter Smith*, *Hero of Omdurman*, *Mrs. E. Beckett*, and *Snowdrift*.

The name of Laing has been so long associated with the *Begonia* that it seems almost unnecessary to allude to the present standard of perfection which has been reached by the firm, suffice it to say that the strain still occupies one of the leading positions in the *Begonia* world. The double varieties are *Picotee*, *Duke of Fife*, *Duke of Sutherland*, *Lady Rothschild*, *Duchess of Sutherland*, and *Lady E. Spencer Churchill*. The single *Begonias* are large and very varied in colouring, the groundwork of Ferns and *Caladiums* render the exhibit attractive and pleasant.

The Swanley firm of Messrs. H. Cannell & Sons also contributes *Begonias* in great variety. The plants are well staged and arranged. The exhibits of *Cannas* and *Gloxinias* also form attractive features of this exhibit. The *Begonias* are dwarf and sturdy, and include such varieties as *Lady Lettie Grosvenor*, *Lady Grosvenor*, *cristata*, *Future King*, *Lady Camden*, *Mr. Ricardo*, and *Miss Courtney*. The *Cannas* are remarkably fine, the blooms being large and in good condition. The best varieties are *Mad. Pichou*, *Beauté Poitevine*, *Burbank*, *Florence Vaughan*, *Robert Christie*, *Duchess of York*, *Sister Dera*, and *Queen Charlotte*. The *Gloxinias* are large and in the pink of condition, the colours vivid, and the markings exquisite.

The exhibit of Messrs. Barr & Sons, Covent Garden, occupies the whole of one side of a tent with a gigantic collection of hardy flowers. Entering the door on the left, we meet a large collection of rock and alpine plants, and a stand of rectified and breeder Tulips in large masses, also on the orthodox boards. The *Darwin Tulips* are also much admired. In the collection of herbaceous flowers, the *Oriental Poppies*, *Pyrethrum Firefly*, *Aquilegia hybrids*, *Sweet Peas*, and *Ixias* form attractive features. The latter form a good collection, which embraces *Snowdrop*, *Nelsoni*, *Azurea*, *Viridiflora*, *Brutus*, *Emperor of China*; *Gladioli insignis*, and *The Bride* were also good. The *Spanish Irises* deserve a word of mention, for they are very varied and bright, as are also the *germanica* and *pallida* types, a truly gigantic display even for Messrs. Barr.

Mr. Maurice Prichard, Christchurch, Hants, stages a choice display of herbaceous and alpine plants in a fresh clean condition; the arrangement is also good. *Pyrethrums*, *Aquilegias*, and *Irises* are well to the fore, while *Dodecatheon Lemoinei*, *Papaver Blush Queen*, *Sedum virens monstrosum*, *Saxifraga granulata plena*, *Geums* in variety, and a host of other hardy plants render yeoman service to this beautiful exhibit.

Mr. A. Perry, Winehamore Hill, N., enriches the show with a collection of hardy flowers, chief of which are *Pyrethrum Mrs. Bateman Brown*, *Polemonium himalaicum*, *Parrot Tulips*, *Phlox Vivid*, a large basket of *Genm Heldreichi* in capital condition, the yellow *Thermopsis montana*, *Iris Susiana*, and *Globularia vulgaris* with many others contribute to the display of this exhibit.

Messrs. Waveren & Kruyff, Sassenheim, Holland, send some of their *Astilbe Spiraeas*, which are much admired. Those exhibited are *Dr. Cattie*, *W. E. Gladstone*, *H. Witte*, and *Professor Suringar*. These are hybrids of *S. astilboides* and *S. compacta*, and undoubtedly possess great value as decorative plants, for they are intermediate between the two forms.

Messrs. T. S. Ware, Ltd., Tottenham, also stage a collection of hardy flowers, which contains *Ononis rotundifolia*, hybrid *Aquilegias* in great variety, *Pæonias*, *Dodecatheons* in good style, *Geums*, *Primulas*, *Spiræas*, and *Liliums*. The exhibit is well arranged, and forms a pleasing change to some of the other exhibits.

Messrs. W. & J. Brakenhead, Sale, near Manchester, again delight the visitors with a choice collection of Ferns. The plants are small, but large enough to show their true characters. The hardy species and varieties are well represented. The greenhouse species, such as *Gymnogramma schizophylla* *superba*, *G. Martensi* *grandiceps*, *Davallia aculeata*, *Lomaria aspera*, and Filmy Ferns complete the display.

Messrs. Paul & Sons, the Old Nurseries, Cheshunt, utilise the space at their disposal for hardy flowers to the best advantage, and their exhibit is meritorious. The *Rhododendrons* *Fortunei* crossed with garden hybrids have formed a new race. The best of those exhibited have larger flowers and trusses than the ordinary garden hybrids. The collection of *Lilacs* also attracts much attention. The varieties are *Souvenir de L. Spath*, *Mathieu Donbasle*, *Madame Kreuter*, *Alphonse Levalle*, and *President Grevy*. Some pretty rock plants, with hardy *Cypripediums* in baskets, are pretty.

Messrs. G. Jackman & Son, Woking, have a collection of hardy flowers, which contains many useful plants. *Anemone sylvestris flore-pleno* is noticeable, as are the *Pyrethrums*, and a collection of Tree *Pæonies*, *Trollius*, *Irises* of the *pallida* type.

An attractive exhibit comes from Messrs. R. Wallace and Co., Colchester, chiefly composed of *Ixias* in excellent variety. *Iris florentina* *Princess of Wales*, *Mayor*, *Susian*, and a collection of *I. hispanica* are clean and fresh. The *Sparaxis* *Fire King* are exceedingly fine, and prove interesting to visitors. The new Japanese *Pæonies* are brilliant and charming, and a collection of hardy *Cypripediums* should be noted, which contain *C. pedatum* *acaule*, *occidentale*, *calceolus*, and *parviflorum*. At the end of the tent the same firm makes a capital show of *Liliums*, *Ornithogalum arabicum*, with *Eremurus himalaicus*, hardy *Bamboos*, *Acers*, and other foliage plants. Mr. R. C. Sanders, gardener to A. de Rothschild, Esq., Tring, exhibits two baskets of *Carnation* *Halton*, a bright red variety.

The *Phyllocacti* hybrids from Messrs. Jas. Veitch and Sons have been displayed at the Temple Show on former occasions, but the present exhibit surpasses in numbers and quality any of its predecessors. The remarkable variation in colouring is really surprising, ranging as they do from creamy white, through all the shades to bright crimson. A few of the most beautiful forms are noted—*Nysa*, a rich crimson, *Marsus*, pink, *J. T. Peacock*, *Sylvia*, *Delicatus*, *Vesta*, and *Agatha*. The collection also contains many unnamed seedlings.

Mr. Poupart, Marsh Farm, Twickenham, sends some fan-shaped sprays of *Lily of the Valley* *Victoria*; the bells are large and pure in colour, and they have been grown in the open air at Twickenham. A good distinct variety.

Messrs. J. Hill & Son, Edmonton, exhibit a collection of Ferns in their well-known style. The specimen plants include *Asplenium caudatum*, *Platynerium aleicorne*, a splendid clump, *Osmunda palustris*, *Goniophlebium subauriculatum*, and *Davallia tenuifolia* *Veitchi*, while the lower part is composed of a great variety of choice specimens in small pots, those with tinted foliage being especially good. Mr. W. Sydenham, Tamworth, stages a collection of Fancy Pansies and Violas. Among the former are *Tom Waters*, *Bernard Doulton*, *David Rennie*, and *Mavourneen*, while the latter are represented by good sprays of *Lark*, a fine new variety; *Symphony*, an edged variety; *Melampus*, a good yellow; Mrs. R. K. Mitchell, *Amy Barr*, *Ophelia*, *Pembroke*, *Nellie Cruse*, and *King Cup*.

Mr. W. Bull, King's Road, Chelsea, has a few good plants of *Dracæna* *Victoria*—a fine form; the flowers are beautifully coloured, and the plant is sure to be useful to decorators. Messrs. W. Paul & Son, Waltham Cross, send nine good boxes of *Rhododendron* blooms. The best varieties are Mrs. R. S. Holford, *Blandyanum*, *Lord Palmerston*, Mrs. Mangles, and *Floretta*; also a few double *Lilacs*, and ornamental foliage growth, which form a pleasing contrast to the flowers.

Messrs. J. Laing & Sons, Forest Hill, have a beautiful strain of hybrid *Streptocarpus* in a large variety of colours, many of them appearing quite new. The exhibit is arranged with plenty of *Maidenhair* Fern and *Isolepis gracilis*, and is certainly attractive; also a collection of new *Dracænas*, *Crotons*, *Aralias*, and other foliage plants. Mr. T. Jannock, Dersingham, Norfolk, presents a grand display of *Lily of the Valley*, the *Fortin* variety, which is certainly larger and superior to the ordinary *Berlin* variety; the bells are very white and deep, and it is a variety that will be popular when it is more general.

The Jadoo Company, Exeter, stages a quantity of plants to illustrate the value of Jadoo fibre for plant culture. The plants are well grown, and certainly a recommendation to the fibre. Messrs. J. Backhouse and Son, Ltd., York, follow with a large exhibit of rock and alpine plants, for which the firm is justly famed. The most prominent are *Saxifraga Stansfieldi*, *Darlingtonia californica*, *Armeria Lancheana*, *Saponaria ocymoides*, and *Gentiana acaulis coelestina*. A most interesting exhibit.

Messrs. A. W. Young & Co., Homedale Nursery, Stevenage, have a creditable exhibit of hardy flowers, consisting of herbaceous plants, also

rock and alpine plants. Messrs. W. H. Rogers & Sons, Limited, Red Lodge Nurseries, Southampton, stage a collection of *Rhododendrons* and *Azaleas* arranged with *Maidenhair* Fern. The trusses are good, and in fresh condition. The chief varieties are *George Hardy*, a splendid white, *album grandiflorum*, *Princess Mary of Cambridge*, *Helen Rogers*, a distinct variety, *delicatissimum*, *Mammoth*, and *Gem*, while bunches of *Azalea pontica* relieve the gorgeousness of their compeers.

Messrs. T. S. Ware, Ltd., Tottenham, also contribute an exhibit of *Pyrethrums*, both single and double varieties, with a few other hardy flowers. The *Pyrethrums* are very bright and fresh looking. The Guildford Hardy Plant Co., Guildford, has an extensive exhibit of rock and alpine plants, also a collection of herbaceous plants, beautifully arranged, which include some pretty *Alpine Auriculas*, *Anemone sylvestris*, *Gentiana acaulis* and *vena*, with a whole collection of Alpines enough to satisfy anyone. The absence of labels no doubt enhances the effect, but it is doubtful whether the visitors appreciate it.

Messrs. J. Cheal & Sons, Crawley, have a collection of *Violas* and other hardy flowers; in the former, *Amy Barr*, *Florizel*, *Princess Louise*, *A. J. Rowberry*, *Border Witch*, *Bridesmaid*, and *True Blue* are most conspicuous. Messrs. R. H. Bath, Ltd., Wisbech, have a good variety of flowers that are well arranged, and include a few *Dahlias* of the *Cactus* type, some splendid *Pansies* of the *Empress* strain; huge bunches of *Carnations* and *Irises* are also in good form, making a showy exhibit that is much appreciated.

FIG. 97.—*PHLOX PHŒBE*. (See page 450.)

Messrs. J. Veitch & Sons, Chelsea, are again in evidence with a collection of well grown *Gloxinias*, both named and seedling forms. The plants are carrying clusters of bloom of the brightest colours, while the spotted varieties are excellent. Following these are a group of *Richardia Elliottiana* producing some splendid spathes of a rich golden yellow. Mr. H. B. May, Dyson Lane Nurseries, Edmonton, presents a good collection of Ferns tastefully displayed. The chief features are *Gymnogramma flavesceens*, *G. Alstonæ* *superba*, *Davallias* in variety, *Asplenium nidus*, various *Pterises*, and *Adiantums* in variety, also a good plant of the new *Zonal Pelargonium* *Decorator*, a fine bright red semi-double of considerable promise. Messrs. I. House & Sons, Bristol, have a good collection of *Violas* and *Pansies*. The flowers have suffered very much from the weather, but the following varieties are good—*Columba*, *Hamish*, *Endymion*, *Cragie*, *A. J. Rowberry*, and *White Empress*. The *Pansies* appear more at home, and include *John Myles*, Mrs. W. Steele, D. G. McKay, and Mrs. Grahame.

Messrs. J. Peed & Son, Upper Norwood, exhibit *Gloxinias* in capital style, the strain is undoubtedly a good one. The plants are bright, and carry a wealth of flowers. The spotted varieties are strong and dense, with plenty of substance. Messrs. J. Kelway & Sons, Langport, occupy a large space with some choice tree *Pæonies*, including such fine forms as *Marchioness of Salisbury*, *Orme*, *Eastern Prince*, *Julius Caesar*, and *Royal Babe*; also some good *Hippeastrums* and herbaceous plants.

A collection of *Carnations* in pots is staged by Mr. Chas. Turner, Slough, which includes *Goldy Locks*, *Lady Hermione*, *Sir Bevis*, *Rizzio*, *Athelwold*, and *Knight Templar*, while the *Malmaison* type is represented by some beautiful *Princess May* *Carnations*.

Mr. W. J. Godfrey, Exmouth, sends some Oriental Poppies in quite art shades, but the heat of the tent has totally destroyed their beauty. Mr. W. Pascoe, gardener to Captain Torrens, Hayes, Kent, staged three Moutan Pæonies. They are very fine, especially Anyoji.

Messrs. Webb & Sons, Stourbridge, contribute a display of Calceolarias and Begonias. The former are well spotted and the colours bright and distinct. The Begonias are dwarf in habit, both double and single forms being represented in a good variety of colours. Messrs. Storrie and Storrie, Dundee, stage a collection of border Auriculas; the best are Victoria, bright yellow; Souvenir de W. E. Gladstone, Hebe, Venus, and Zenobia, all of the same yellow shades; also some floral designs carried out with the same flowers. The collection of herbaceous Calceolarias placed on view by Messrs. Carter, High Holborn, is certainly one worthy of the firm. The spotted forms are excellent, as is also the variety Cloth of Gold. The plants are nicely arranged in a bed of Ferns and Isoplepis. The same firm also exhibits good strains of Mimulus, Giant Mignonette, and Petonias.

Mr. H. J. Chapman, gardener to R. I. Measures, Esq., stages an interesting collection of insectivorous plants which attracts the visitors. The *Drosera spatulata*; *Darlingtonia californica*, a good specimen; *Sarracenia Feildsi*, *S. Drummondii*, *Nepenthes Mastersii*, *Sarracenia Chelsoni*, *S. exoniensis*, *S. Willisi*, and *S. Courti* are all large typical plants. The groundwork is composed of Maidenhair Ferns and small Palms. The Anglo-Continental Guano Company has a display of miscellaneous plants.

CERTIFICATES AND AWARDS OF MERIT.

Acer pseudo-Platanus elegantissima variegata (T. Perkins).—A broad-leaved species, with a sort of tricolor growth; some of the leaves are creamy, with a tinge of red on the surface, giving it a most attractive appearance (first-class certificate).

Anemone sylvestris fl. pl. (G. Jackman & Son).—A charming flower that is perfectly double and pure white save for the green in the centre (award of merit).

Begonia Miss Barbara Ray (T. S. Ware, Ltd.).—A superb double variety of a very rich orange colour (award of merit).

Begonia Duke of Devonshire (T. S. Ware, Ltd.).—A brilliant scarlet crimson double variety, with petals of exceptional size (award of merit).

Begonia Miss Mary Poje (T. S. Ware, Ltd.).—A magnificent double white, with very large wavy margined petals (award of merit).

Begonia Miss Bella Tait (T. S. Ware, Ltd.).—One of the best double Begonias in the show. The colour is rich salmon pink (award of merit).

Cattleya Aphrodite Ruth (Lupton).—One of the handsomest Orchids in the whole exhibition. The narrow slightly recurving sepals are delicate blush, and the broader wavy petals milk white with a suspicion of pink. The beautifully fimbriated lip is brilliant maroon with a lemon yellow throat (first-class certificate).

Cattleya Mossiae gloriosa (Lupton).—A flower that combines substance and quality with size. The sepals and petals are purplish rose, the latter being of immense breadth. The lip is broad, crimson in colour, and with a rose margin. The side lobes and throat are golden yellow (award of merit).

Cattleya Eudora Madame Albert Hye (Jules Hye).—A singularly handsome variety. The fine sepals and petals are soft rose with deeper markings. The broadly expanded lip is rich velvety crimson, the throat being yellow with crimson veins (first-class certificate).

Cattleya intermedia var. Rosslyn (H. T. Pitt).—A chastely beautiful and very refined flower. The colour is ivory white, with flushes of delicate rose, particularly in the tube of the throat (award of merit).

Cattleya Mendel Burford variety (W. H. White).—Probably one of the most refined types of Mendel in the show. The sepals and petals are rose, and the front portion of the fimbriated lip crimson suffused with purple. The side lobes are yellow paling to white; the throat is yellow with crimson veins (award of merit).

Cattleya Mossiae Grosseniana (W. H. White).—A very distinct variety. The sepals and broad petals are soft blush. The lip is exceptionally dark purple crimson, with a beautifully fimbriated white margin. The throat is yellow (award of merit).

Cattleya Mossiae Beauty of Bush Hill (H. Low & Co.).—Undoubtedly one of the most striking varieties of Mossiae that has ever been staged. The sepals and petals are pale purplish rose, with veins of almost white. The lip is crimson on the centre lobe, yellow in the side lobes, and with a crimson veined throat. The margin of the lip is rose (first-class certificate).

Cattleya Mendel Perfection (H. Low & Co.).—A finely formed Mendel with petals of exceptional width. The colour of sepals and petals is rose with the slightest flush of purple. The heavily fimbriated lip is bright crimson (award of merit).

Cattleya Mossiae Mrs. Fieling (S. Mobbs & Ashton).—A richly coloured variety. The sepals and petals are intense rose, and the lip is velvety crimson, with a golden yellowish throat, and an elegantly fimbriated margin of rose (award of merit).

Dracaena cannaefolia variegata (J. Laing & Sons).—An effective plant for decoration. The leaves are deep green, with cream margins and occasional stripes (award of merit).

Heliconia Sanderi (F. Sander & Co.).—A strikingly handsome plant of which the large leaves are deep green, golden, and almost white (first-class certificate).

Ilex Wilsoni (Fisher, Son & Sibray, Ltd.).—A broad-leaved form with Laurel-like spiny leaves; evidently a robust form (first-class certificate).

Juniperus Sanderi (F. Sander).—A graceful little plant with glaucous green leafage (award of merit).

Ixia purpurata Annie Louise (G. W. Law Schofield).—This is a most handsome form. The sepals are very pale rose, and the broad slightly wavy petals are rose, with bright crimson veinings and a paler base. The superb lip is rich crimson, deepening towards the throat and side lobes (first-class certificate).

Mittonia vexillaria dulcotense (W. Cobb).—This flower is not large, but the colour of the broad shapely lip is rich pink suffused with purple. The sepals are pale rose, and the petals somewhat deeper in shade (award of merit).

Mittonia vexillaria Lindenii (L. Linden).—A lovely flower. It is large in size, and of good form. The sepals and petals are rich rose, and the broad lip soft rose, paling to white at the margins (award of merit).

Odontoglossum crispum Etoile de Congo (Jules Hye).—An effective flower, of good form. The colour is white, with flushings of rose in the sepals and petals and pale crimson blotches (award of merit).

Odontoglossum Lalli de Lairesianum (Jules Hye).—A most remarkable flower. The colour throughout the whole of the organs is pale yellowish green (award of merit).

Odontoglossum crispum Miss Linden (L. Linden).—A small but chaste variety. The prevailing colour is white, with numerous chocolate spots, and a blotch on the lip (award of merit).

Odontoglossum triumphans hybrid King Alfred (W. Stevens).—This flower has form, colour, and substance. The sepals and petals are bright yellow, tinged with green at the tips, and paling to white at the base, with immense blotches and spots of brown. The lip is serrated; pale yellow at the base, and chocolate on the front lobe (award of merit).

Odontoglossum crispum Arthur Brisco (W. Stevens).—A beautiful *Odontoglossum*. The colour of the finely formed flower is pure white with large and regular crimson-brown sepals and blotches (first-class certificate).

Pæony Cecil Rhodes (J. Kelway & Son).—A single tree Pæony of good size. The colour is red (award of merit).

Pæony Miss Beatrix Jones (J. Kelway & Son).—A white, single tree variety, of chaste beauty (award of merit).

Phalænopsis Sanderiana Wigani var. (W. H. Young).—This is a charming variety, of which the colour that prevails over the whole flower is purplish rose (award of merit).

Phyllocactus Nysa (J. Veitch & Sons).—A finely formed variety of large size. The colour is bright red (award of merit).

Phyllocactus Admiration (J. Veitch & Sons).—A smaller flowered variety than the foregoing. The colour is soft pink (award of merit).

Phyllocactus J. T. Pearock Improved (J. Veitch & Sons).—A superb variety. The colour is brilliant red with a purple suffusion in the centre petals (award of merit).

Polystichum angulare divisilobum plumosissimum (W. & J. Birkenhead).—With a name such as the above it would be entirely superfluous for us to give a description (first class certificate).

Thunia Bensoniae superba (W. H. White).—The rich dark purplish crimson flowers of this variety honestly entitle it to the name of *superba* (award of merit).

FRUITS AND VEGETABLES.

Though the last week in May is early for growers of fruits and vegetables to show produce of the highest excellence, they are ever to the fore with exhibits that for the time of year reflect the greatest credit on every one concerned in their production. On the present occasion there are, we think, rather more exhibitors in the section than is customary, and with the numerical increase we are glad to say there is no diminution in the quality. There are large stands and small ones, comprising all crops that can now be staged, and it must be a relief for the visitor to turn from the brightness of the flowers to the more modest beauty of the fruits and the vegetables.

Messrs. T. Rivers & Son, Sawbridgeworth, occupy a position in the large marquee with their unrivalled collection of pot fruit trees. Visitors have become accustomed to the Sawbridgeworth quality, and they will be more than satisfied this year. The group is not all Nectarines, but includes Peaches, Cherries, and Plums. The beautifully grown trees, with their clean wood and stout healthy leafage, contain, of Nectarines, Dryden, Stanwick Elruge, Early Rivers, and Cardinal; with Cherries, Belle d'Orleans and Early Rivers; and Peaches, Stirling Castle, Royal George, Dagmar, Hale's Early, Dr. Hogg, and Crimson Galande. We agree with the remark of a visitor that at least one of the ten commandments will be broken during this show.

The whole of the central staging in the smallest tent is occupied by Messrs. J. Carter & Co., High Holborn, with a most meritorious exhibit, comprising flowers and vegetables. The arrangement is decidedly artistic, and attracts considerable attention for this reason as well as on account of the excellent quality of the several products requisitioned. Amongst the flowers are handsome examples of Victoria Prize Calceolarias; Invincible Prize Gloxinias and Petunias are most attractive. They are from the firm's nurseries at Perry Hill. The more utilitarian portion of the stand comprises Royal Osborne Cucumber, Carter's Foreign Turnip, Duke of York Tomato, climbing French Beans, Daisy Pea, Early Favourite Potato, Model Leek, White Cos Lettuce, Foreign Cauliflower, and Early Morn Pea.

Messrs. Laxton Bros., Bedford, are represented by an exhibit of their Strawberries. There are about three and a half dozen plants in pots, every one of which is carrying a number of ripe luscious fruits, and others in varying stages of development. The varieties include Leader and Fillbasket, the latter producing an exceptionally heavy crop.

From the Horticultural College, Swanley, comes a collection of vegetables in variety, including Peas Sutton's Excelsior and American Wonder;

Cabbages Early Offenham and Cannell's Reliance, Tomato Up-to-Date, Cucumber Magnum Bonum, Potatoes Ringleader, Early Puritan, and Sharpe's Victor, Marrow Long White, Beans Negro and Canadian Wonder, Lettuces Tom Thumb and Epicure, Radish French Breakfast, Carrots Sutton's Invincible and Champion Horn, with Turnip Early Snowball, Beet Dell's Crimson, and several others. On the whole this is a creditable exhibit.

A collection of choice fruit has come from Mr. J. McIndoe, gardener to Sir Joseph Pease, Bart., Hutton Hall, Guisborough. There are three seedling and one Scarlet Premier Melon, Grosse Mignonne Peaches, and Early Rivers Nectarine, McIndoe's Russet and Carbine Apples, Downton, Black Tartarian and Bigarreau Napoleon Cherries, Imperial Lemons, Lime Exquisite, Brown Turkey Figs; Catillac Pears, and Lawrence's Favourite Tomatoes. The Grapes include Early Summer Frontignan, Black Hamburgh, and Foster's Seedling. All the varieties are in good condition.

Plants of Strawberry Lady Suffield are to be seen as grown by Mr. W. Allan, gardener to Lord Suffield, Gunton Park, Norwich. It is a dark coloured variety of fair flavour. Mr. B. Ashton, gardener to the Earl of Lathom, Lathom House, Ormskirk, stages three dishes of Peaches. The fruits are not large but very rich in colour.

Mr. W. Fyfe, gardener to Lord Wantage, V.C., Lockinge Park, Wantage, contributes a collection of fruit in several varieties, and the condition of the produce is extremely creditable. The Melons British Queen and Hero of Lockinge are splendid, as are the Stirling Castle Peaches and the Impératrice Nectarines. Figs Brown Turkey and White Ischia, with Tomato Dwarf Champion and Apples Fearn's Pippin and Jack, also claim attention. Besides these there are Monstera deliciosa, Citron, and Buckland Sweetwater, Madresfield Court, Foster's Seedling, and Black Hamburgh Grapes, all of good size and finish.

The largest collection of vegetables sent by an amateur grower is probably that from Mr. W. J. Empson, gardener to Mrs. Wingfield, Ampthill House, Ampthill, Beds. This occupies a considerable amount of space, and must be placed amongst the most creditable stands in the whole exhibition. There are Peas Carter's Blue Express and re-selected Express in pots, with pods of Early Morn and Daisy; Beans are represented by Seville, Mammoth Longpod, Green Windsor, Climbing French, Osborne's Forcing, and Ne Plus Ultra; Tomatoes Duke of York, Market Favourite, Warden Park Favourite, and Dedham Favourite; Leeks Lyon and Model; Turnips Purple-topped Strapleaf and Early Milan; Broccoli Carter's Summer and Universal, with Sharpe's Victor and First Crop Potatoes, Asparagus, Cabbages, Lettuces, Radishes, and splendid Royal Osborne Cucumbers. Of fruit Mr. Empson sent a grand bunch of Musa Cavendishi, Strawberries Royal Sovereign and Leader, with several Melons.

Half a dozen boxes of Cucumbers, seven boxes of Tomatoes, with one and a half dozen Melons constitute Mr. S. Mortimer's exhibit from Rowledge, Farnham. It is a most interesting stand, and deserves all the attention given to it. The Cucumbers are Success, Prizewinner, The Keeper, Express, Improved Telegraph, and an unnamed seedling. The Tomatoes include The Cropper, Chemin Rouge, Perfection, Sutton's A1, Mitchell's Hybrid, and Dessert. Several of the Melons are of handsome appearance.

Fruits and vegetables in about equal quantities are found in the stand from Mr. J. Ryder, gardener to the Countess of Limerick, Hawkswick, St. Albans, and all alike are of good quality. Peaches, Strawberries, Melons represent the former, and Turnips, Carrots, Beans, Potatoes, Asparagus, Broccoli, and Tomatoes the vegetable section. The Royal Sovereign Strawberries and Grosse Mignonne Peaches are perhaps the pick of the collection. Mr. W. Robins, gardener to Col. Lee, Hartwell House, Aylesbury, shows Hale's Early Peaches in good form, with Beauty of Windsor Melons. Messrs. A. W. Young & Co., Stevenage, have a number of fruits of Tomatoes, Young's Eclipse, a shapely variety of good colour.

Messrs. A. J. Harwood, St. Peter's Street, Colchester, Frank Chapman, 57, Crouch Street, Colchester, and W. Godfrey, Colchester, send some bunches of immense Asparagus, the latter showing also a few stalks of a very big Rhubarb. Mr. R. E. Addey, Ealing Road, Brentford, shows Mushroom, spawn and Mushrooms in various stages of development. They are in fine condition. Mr. J. Crook, gardener to W. H. Evans, Esq., Forde Abbey, Chard, exhibits Foreign Bean Progress, Tomato Surprise, Potato Sharpe's Victor, with Apple Sturmer Pippin.

Mr. W. L. Bastin, gardener to A. Henderson, Esq., Buscot Park, Faringdon, sends a miscellaneous group of fruits and vegetables, including, in most creditable condition, all those now procurable by proper methods of culture. There are about a dozen and a half of Melons, with Foster's Seedling and Black Hamburgh Grapes, Early Mignonne Peaches, and Lord Napier Nectarine, and such vegetables as Broccoli, Asparagus, Cucumbers, Tomatoes, Beans, Marrows, Peas, Carrots, Lettuces, and others.

One of the most meritorious exhibits in the fruit section is that from Messrs. G. Bunyard & Co., Maidstone, who are showing Apples as few growers in this country could do at this season of the year. Scores of varieties are represented in condition almost equal to that of many growers' produce at Christmas. We cannot enumerate all, but must call particular attention to Lord Derby, Calville Rouge, Betty Geeson, Calville Malingre, Beauty of Kent, Annie Elizabeth, Alfriston, Gooseberry Apple, Allington Pippin, Belle de Pontoise, Small's Prince Arthur, Tibbett's Pearmain, Murfitt's Seedling, Bismarck, Hormead's Pearmain, Gloria Mundi, Striped Beefing, Mère de Ménage, and Hoary Morning. There are also from Maidstone a few fruit trees in pots in capital condition.

A most striking exhibit is that from Messrs. Sutton & Sons, Reading

It comprises a central pile of Tomato Sutton's Winter Beauty encircled by baskets of Green Peas. These are not empty pods, but contain peas of good size and colour. The varieties comprise Sutton's Early Giant, May Queen, Empress of India, Bountiful, Excelsior, A1 Seedling, and selected Duke of Albany. These all come within the designation of Marrowfat varieties, and will be appreciated for their earliness and excellent quality.

MEDALS AND CUPS AWARDED.

GOLD MEDALS.—Sir Trevor Lawrence, Bart., and Mons. Jules Hye, for Orchids; Messrs. J. Veitch & Sons, Ltd., for Phyllocacti, Gloxinias, Caladiums, shrubs, and foliage plants; Messrs. Fisher, Son, & Sibray, for shrubs and foliage plants; and Messrs. T. S. Ware, Ltd., for Begonias.

SILVER CUPS.—Messrs. L. Linder, W. H. Young, F. Sander & Co., Charlesworth & Co., H. Low & Co., for Orchids; Messrs. Paul & Son, G. Mount, and W. Paul & Son, for Roses; Messrs. Wills & Segar for foliage plants, and Messrs. J. Laing & Sons, Streptocarpus, Caladiums, and Begonias; Messrs. G. Bunyard & Co. for Apples and fruit trees; W. Fyfe for fruit; T. Rivers & Son for fruit; H. B. May for Ferns; Sutton & Sons for vegetables and Calceolarias; Backhouse & Co., Ltd., for miscellaneous plants; W. Stevens, J. Rutherford, and Cypher & Co., for Orchids; and C. Turner, Slough, for Roses and other plants.

FIG. 98.—ODONTOGLOSSUM CORADINEI MIRABILE. (See page 450.)

SILVER-GILT FLORA MEDALS.—Messrs. Stanley Mobbs & Ashton for Orchids; R. & G. Cuthbert for Azaleas; C. Blick for Carnations; G. Jackman & Son and Smith & Co. for Clematis; the Guildford Hardy Plant Company for Alpines; J. Kelway & Son for Pæonies; W. Cutbush and Son for flowering shrubs; J. Hill & Son for Ferns; Fromow & Co. for Maples; R. Wallace & Co. for Lilies; J. Waterer for Rhododendrons; H. Cannell & Sons for Cannas and Begonias; G. Hunt for Caladiums; and J. Peed & Son for Caladiums and Gloxinias.

SILVER FLORA MEDALS.—Messrs. M. S. Cooke for Orchids, and J. Cripps & Son for Maples.

SILVER-GILT BANKSIAN MEDALS.—Messrs. E. Carr, G. Cragg, and B. S. Williams & Son for Orchids, A. Perry for hardy flowers, W. Bull for Dracænas, W. & J. Birkenhead for Ferns, W. Leeton for Palms, J. Russell for hardy shrubs and Azaleas, Barr & Sons for hardy plants, J. Carter & Co. for Calceolarias and vegetables, and the Swanley College for vegetables.

SILVER BANKSIAN MEDALS.—Messrs. L. Mond for Orchids; Webb and Sons for Calceolarias and Gloxinias; M. Prichard for hardy flowers; I. House & Son for Violas; T. Jannock for Lily of the Valley; Van Waveren for Spiræas; W. Poupert for Lily of the Valley; Storrie for Auriculas; T. Perkins for Sycamores; R. Hoffman for Caladiums; W. Godfrey for Asparagus and J. Ryder for vegetables.

SILVER-GILT KNIGHTIAN MEDALS.—Messrs. A. Henderson and J. McIndoe for fruit, and W. J. Empson and S. Mortimer for fruit and vegetables.

We must not bring this report to a close without offering a tribute to the several officials who have worked so strenuously to make the whole exhibition a success. They have done wonders, and the smoothness with which everything proceeded showed how thoroughly the preliminary operations had been carried out. The Rev. W. Wilks, Mr. Frank Reader, Mr. S. T. Wright, and Mr. T. Humphreys deserve the thanks of every person who enters the Temple Gardens during the continuance of the show, as do their several assistants, for good work cheerfully and courteously done.

RECENT WEATHER IN LONDON.—At last a welcome change has come and we are not being nipped by bitterly cold winds and sharp morning frosts. On Sunday it turned materially warmer, though the wind remained in the same quarter. On Monday it was quite mild as compared with the conditions of the preceding week. Tuesday was quite summer-like, and encouraging to Orchid exhibitors when preparing for the Temple Show. Wednesday was bright and fine.

— WEATHER IN THE NORTH.—A pleasant change took place on Saturday on the continuously cold and wet weather that has prevailed so long. With a change of wind to the S.W. two delightfully bright and warm days followed, although there was a distinct touch of frost on the morning of each. Monday morning scarcely so bright, still promised a fine day.—B. D., *S. Perthshire*.

— REGAL PELARGONIUM WHITE GEM.—This I noted recently, and I think it is going to be a really good thing. Those of us who have been trying to grow such kinds as *fimbriatum album*, or the pure white varieties, and perhaps given up their culture for such second-rate white as *Princess Alexandra*, will be pleased to know of a good grower with flowers absolutely pure white, and this I feel positive we shall have in *White Gem*. Little bits rooted quite late in autumn are now nice plants, bushy and strong, and flowering freely.—H. R.

— NOTTINGHAMSHIRE HORTICULTURAL SOCIETY.—On July 12th and 13th the grounds of Nottingham Arboretum will be gay with the annual Show and Garden Party of the above Association—that is if, as is hoped, the weather prove propitious. There are about fifty classes in all, of which the principal is for a 200 feet group of miscellaneous plants. The first prize, offered by Lord Henry Bentinck, M.P., is £10 and a silver cup, the remaining awards being £12, £8, and £5 respectively, with £1 for unsuccessful exhibitors. Some of the classes are open to all, while others have certain limitations placed on them. The Hon. Sec., from whom all particulars may be had, is Mr. C. J. Mee, 29, Long Row, Nottingham.

— MASSACHUSETTS HORTICULTURAL SOCIETY.—A report of the proceedings of this Society is embodied in a book of 186 pages, this dealing only with the meetings held during the first quarter of 1898. In addition to routine business with some particulars relative to prize money at shows, there are exhaustive papers on "The Business Side of Fruit Culture," by Mr. J. Hale; "Horticulture in Holland, Decoration in Public Places, Bulb Growing, Nursery Stock at Boskoop," by Mr. J. K. M. L. Farquhar; "Originating New Vegetables," by the Hon. Aaron Low; "Nuts and Nut Culture," by Mr. F. M. Bartram; "Some New Notions about Some Old Insects," by Mr. M. V. Slingerland; "Rambling Notes on Trees in Streets and Elsewhere," by Mr. W. R. Smith; "The National Flower Movement," by Mr. F. L. Sargent; "The Relation of Public Schools to Rural Life," by Mr. G. T. Powell; "The Resistance of Plants to Parasitic Fungi," by Mr. E. D. Bart; "Some Native Ferns of New England," by Mr. H. L. Clapp; and "Wild Flowers of the Canadian Rockies," by Mr. C. Van Brunt. Discussions followed the major portion of the papers, these also being printed.

— "JOHNSON'S GARDENER'S DICTIONARY."—Once again has this excellent dictionary had to be revised and enlarged for publication, and the facilities for the purchase of the complete work are on this occasion easier than ever—in fact, the conditions bring it within the reach of all. It was first published nearly fifty years ago, and that it maintains its popularity is proof that it contains valuable information. Of what value it has been to present day gardeners it is impossible to estimate, but it must have been of immense service. As it was and is valuable to many persons now, so it must be to the rising generation, not alone because of the carefully compiled lists of plants, but also by reason of the thoroughly sound cultural details that are given of the most popular fruits, plants, and vegetables. It is now being brought out in weekly parts of which thirty-three will complete the work, and the price is 3d. per part, or 3½d. post free. The main object of its publication at this price is to bring it within the reach of young gardeners, to whom it is one of the first books on gardening that we recommend. It may be procured from the publisher, *Journal of Horticulture*, 12, Mitre Court Chambers, Fleet Street, E.C. It is taken for granted that the matter will be carefully revised. A few reference notes in the last edition require attention.

— BRISTOL GARDENERS' ASSOCIATION.—A large number of members attended the opening meeting of the summer session to hear a paper on Tomato Culture by Mr. C. Lock, the Chairman of the Society. Mr. W. A. Garaway presided. Mr. Lock dealt with the mode of culture for early, midseason, and late crops. He made the daring statement that though a large number of people grew Tomato plants not more than 10 per cent. succeeded in growing them as successfully as they ought to do. The essayist gave practical advice on all details of cultivation, also dealing with the diseases Tomatoes are subject to. The paper was much appreciated, and a vote of thanks was given Mr. Lock. Prizes for a brace of Cucumbers were awarded Messrs. Marshall and Frampson, and the Society's certificate of merit was awarded Mr. Shaddick for a fine specimen of *Cypripedium barbatum*.

— CRYSTAL PALACE.—The programme of the general arrangements that have been made by the directors of this pleasant resort, is exceptionally diversified and complete. Every day and almost every hour has its distinct attractions, in addition to which there are numerous special features that cannot fail to receive tangible appreciation. So far as the horticultural world is concerned, visitors have, on ordinary days, the beautiful grounds; the National Rose Society's Metropolitan Show on July 1st; the National Carnation Society's Exhibition on July 24th; the Co-operative Flower Show and Festival on August 19th; the National Dahlia Society's Show on September 1st and 2nd; and the Royal Horticultural Society's Show of British-grown Fruit on September 28th, 29th, and 30th. Several additional rules have been framed for the advantage of season ticket holders—indeed, everything seems to have been done to enhance the pleasure of a visit to Sydenham. It is stated in the programme that there have been 91,293,474 visitors from June 10th, 1854, to April 30th, 1899, or an average of upwards of two millions per annum.

— DORNDEN.—Situated on "the rocky road to Dublin," this is, for its size, one of the most charming homes of gardening on the sea-side of the Milesian metropolis. In the keep of the place, in the variety of plants to be found in it, and high-class culture displayed in them, as well as the vegetable quarters, it is to-day a speaking witness of that indefatigable zeal with which Mr. Carroll, the gardener, has wrought for the past ten years. Unfortunately, Mrs. Burrowes, its octogenarian mistress, is debarred to some extent through the winter from the pleasure it yields even at that season. A feature of Dornden is the Iris borders, bisected by a grass walk, consisting of an extensive collection of the *Germanica* section, respecting which a note may be sent later on. Fine plants of the *Powercourt* variety of *Phormium tenax* are very attractive. This is distinguished from the type by its erect habit and bolder character; it is, I am told, also hardier. In his love of hardy plants Mr. Carroll displays what would be expected of one who spent some time in the College Gardens, Dublin, and no better testimonial of his taste and energy could be given than what is exemplified in Dornden.—K.

— NOTES FROM LONG DITTON.—When the late Tulips are in glorious bloom, how delightful is it to walk through the Long Ditton grounds, for besides these rich-coloured flowers, how many other of less gorgeous, though hardly less interesting, are in flower. The great breadth of the Darwin, Dideiri species, and other late Tulips, present altogether such surprising beauty and coloration as compared with what is presented by a few flowers when set up in vases. Tulips want to be seen under a bright light out in the open. It need not necessarily be bright sunshine, although that does light up the rich reds and roses as with fire. But even under the dullest skies, they furnish colour that is as brilliant as it is beautiful. How beautiful too, in masses on the mounds and stones, are the varied *Aubrietias*. *Hendersoni*, blue; *Leichtlini*, red; *Fire King*, deep red; and others. It is not until these are seen, like cataracts of colour falling over the rockwork, that their beauties are fully realised. What a pretty lavender blue flowered plant is *Polemonium reptans*. It reaches, when in bloom, a height of 9 inches, and makes a charming mass. This associates capitally with the double white *Saxifraga granulata*. *Gentiana verna*, in clumps on a carpet of *Sedum Lydium*, is also a truly lovely plant. Its blue colour is exquisite. A rich orange yellow body of colour is furnished by the creeping *Caltha parnassifolia*, which would make a striking carpet for purple Stocks. The variegated Ground Ivy, *Nepeta hederacea variegata*, is a very striking and free-growing rock plant. One of the prettiest Buttercups is *Ranunculus graminifolius*, flowers soft yellow, single, like those of small Iceland Poppies, borne on stems 14 inches in height. How light and graceful are the feathery like seed heads of *Anemone pulsatilla*, so charming for vase decoration. Singularly brilliant are the rich yellow heads of *Euphorbia pilosa major*, 10 inches in height.—D.

The weather during the week has been generally dull with cold winds.

— FROSTS IN MAY.—An occasional touch of frost in May is common enough, but a succession of cold nights such as we had last week is unusual at any time in the month, and especially so towards the close. In some parts of the midland counties the thermometer on the three nights ending Friday 26th fell below the freezing point, not only in the open, but also in the shelter of the screen. On the surface of the grass the frost was more general, and was in many places sufficiently sharp to cause a large amount of damage to the crops. Even at Greenwich the exposed thermometer fell to the freezing point on Thursday night, and 3° below it on Friday. At Oxford there were 2° of frost on Thursday night, and 4° on the nights both of Friday and Saturday. Further in the interior the frost was still keener, the exposed thermometer at Loughborough in Leicestershire falling 7° below the freezing point on Thursday night, 8° below it on Friday, and 6° below it on Saturday. The ground frosts came with an anti-cyclone, which drifted over the country from the north-westward, and which was attended by fine, clear nights, leading to brisk terrestrial radiation. In the daytime the sky unfortunately clouded over, and as the wind blew from the north-eastward the weather was extremely cold and harsh. On Thursday and Friday the thermometer over the eastern and central parts of England rose very little above 50°, and was at least 16° below the average for the time of year. Saturday brought in a little more sunshine, with day temperatures of 55°, or a trifle above. On Sunday night, 28th, there were 6° below freezing. We have observed that much injury has been done to Potatoes and Strawberries in some districts.

— Disastrous frosts occurred in Bedfordshire on Friday, Saturday, and Sunday, May 26th, 27th, and 28th. These varied in different situations, and at the lower elevations from 3° to 7° (*i.e.*, the readings were 29° to 25° Fahr.). During the week preceding the 26th we had about 1½ inch of rain, the soil was consequently saturated and the trees and plants filled with moisture. The result is that much damage has been caused to fruit and vegetable crops, Apples being in full blossom, and many of the early Strawberries also have their flowers expanded, while early Potatoes have been cut down in all directions except on the highest land. I hear of Tomatoes that have been put out in early districts, Runner Beans, and many ornamental garden plants that are seriously injured.—R. L. CASTLE.

— GLASS STRUCTURES AT DALKEITH.—That Mr. Dunn's successor in this great charge will have plenty to do will be evident from the following measurements, which were supplied to us by the deceased chief some years ago. It is only men of the best intelligence who can control and put to profitable use such an immense extent of glass. Camellia house, 60 feet by 25 feet; Orchid house, 55 feet by 25 feet; stove, 30 feet by 23 feet; greenhouse, 150 feet by 12 feet; intermediate house, 150 feet by 12 feet; Muscat vinery, 80 feet by 18 feet; early vinery, 60 feet by 11 feet; late vinery, 100 feet by 12 feet; three ranges of pits, each 150 feet long, utilised for Pines, Cucumbers, and Melons; Fig house, 80 feet by 14 feet; early Muscat house, 80 feet by 14 feet; forcing house, 370 feet long, divided into nine compartments of varying lengths and widths; range, 450 feet by 9 feet, in which were Apricots, Figs, Pears, Plums, Cherries, and Chrysanthemums; fruiting Pine stoves, 200 feet by 12 feet, in three divisions. Of the Heath house, fernery, and the celebrated conservatory with its ornately carved stonework, the dimensions were not given.

ROSE SHOW FIXTURES IN 1899.

- JUNE 13th (Tuesday).—Cambridge.
 „ 14th (Wednesday).—York†.
 „ 21st (Wednesday).—Isle of Wight (Shanklin).
 „ 24th (Saturday).—Windsor.
 „ 27th (Tuesday).—Westminster (R.H.S.).
 „ 28th (Wednesday).—Bath, Croydon, Maidstone, Reading, Richmond, and Ryde.

* Show lasting two days. † Shows lasting three days.

The above are all the dates definitely decided upon that have as yet reached me. I shall be glad to receive the fixtures of any Rose shows not named above, or those of any horticultural exhibitions where Roses are made a leading feature, for insertion in future lists.—EDWARD MAWLEY, *Rosebank, Berkhamsted, Herts.*

THE DRILL HALL ROSE SHOW.

IN a recent issue we called attention to the two shows of the National Rose Society at the Crystal Palace and at Colchester, and referred to this Society's collaboration with the Royal Horticultural Society at the Drill Hall on Tuesday, June 27th. The schedule of this show is now to hand, and it comprises fifteen classes. These are divided into seven for mixed varieties, six for Teas and Noisettes, with two for garden Roses. The two principal classes in the first section are for twenty-four distinct single trusses open to all, and eighteen distinct confined to amateurs, the prizes in each case being £3, £2, and £1. For Teas and Noisettes there is an amateurs' class for eighteen single trusses in not less than twelve varieties, with two prizes of the respective values of £3 and £1 10s., and an open class for eighteen distinct single trusses with £2 10s. and £1 10s. We observe that the National Rose Society contributes £15 10s. towards the total prize money, and it will be regrettable if there is not a thoroughly good display.

PAULOWNIA IMPERIALIS.

IN the south-west counties and other favoured localities where little frost is experienced, fine specimens of this noble Japanese tree are occasionally met with, and where such are to be found few objects are more beautiful during the flowering period. When grown naturally it forms a bushy headed tree, sometimes 40 feet high, but more frequently not more than half that height. The leaves on mature plants are about 9 inches across, soft in texture and hairy. The flowers are produced in May; they are borne in upright panicles, and resemble in shape those of a Tecoma; they are 2½ inches long, the calyx brown and felty, the corolla mauve with a whitish throat, and fragrant. Almost any soil is suitable for it, provided it is not too rich, as in that case growth is too vigorous and the shoots do not become properly ripened.

Although it is seldom flowered except in the places mentioned, it may be grown further north with success as an ornamental foliage plant. When cultivated for this purpose, a number of plants should be grouped and cut down to within a few eyes of the ground each spring. When growth commences, the strongest shoot only on each plant should be allowed to grow; this, during the summer, will attain a height of 8 or 10 feet, and will carry leaves from 1½ to 2 feet across. When grown in this manner rich soil should be given, as all the soft growth killed during winter must be cut away in spring. Several large groups are grown in this manner at Kew, and make an agreeable change among other shrubs, the large handsome foliage having quite a tropical appearance. Grown in pots, cut down annually, and fed heavily, useful ornamental plants can be had for decorative purposes during late summer and autumn.—W. D.

PHAIUS PHOEBE.

This is one of the handsomest hybrid Phaius that has yet been exhibited, and it was immensely admired at the Drill Hall on May 16th, when it was shown by Mr. W. Murray, gardener to Norman C. Cookson, Esq., Wylam-on-Tyne, and received a first-class certificate. As may be seen in the illustration (fig. 97, page 445), the flower is superb, and merits the encomiums showered upon it. It is a hybrid that resulted from a cross between Phaius Sanderianus and P. Humbloti. The sepals and petals are a curious shade of cinnamon yellow with rose shading to white at the margins. The magnificent spreading lip is rose with deeper veins and a fringed margin. The throat is bright yellow and crimson, these hues extending to the side lobes. In form it somewhat resembles P. Cooksoniae, which, it will be remembered was shown before the Royal Horticultural Society in 1895, and was figured in the *Journal of Horticulture* for June 13th, 1895, page 513.

ODONTOGLOSSUM CORADINEI MIRABILE.

It is probable that this Orchid secured as much attention as any in the Drill Hall on the 16th ult., as it was of such exceptional quality. It is probable that a finer form of Coradinei has never been shown, and the first class certificate recommended by the Orchid Committee was thoroughly deserved. The flower is singularly beautiful and of exceptional substance. The broad, slightly-fringed, petals have a large central blotch of light chocolate, with one or two spots of similar colour on the glistening white ground. In the lip and sepals the chocolate colouration extends over almost the whole surface. The woodcut (fig. 98, page 447) represents the natural size of one of the flowers on the spike. The plant came from Mr. H. Ballantine, gardener to Baron Schröder, The Dell, Egham, and is worthy the best traditions of that famous collection.

ORCHID SALE AT TYNTESFIELD.

The duplicate plants in Mr. F. Hardy's splendid collection at Tyntesfield were recently put up for auction by Messrs. Protheroe and Morris, and, needless to say, attracted a large number of enthusiastic Orchid growers. There were upwards of 700 lots for disposal, and two days were allotted to the sale. Amongst the principal buyers were Messrs. J. Veitch & Sons, Ltd., H. Low & Co., F. Sander & Co., Tracey, and A. Outram. Some of the plants for which the collection is renowned fetched good prices, such as *Sobralia Keinastiana*, 9 guineas; *Cattleya Bowringiana*, 15 guineas; *Cypripedium Fred Hardy*, 50 guineas; *Laelia purpurata Hardyana*, 18 guineas; *Laelio-Cattleya Arnoldiana superba*, 12 guineas; *Laelia anceps Amesæ*, 14 guineas; *Cypripedium insigne Sanderæ*, 30 guineas; *Cypripedium James H. Veitch*, 50 guineas and 80 guineas; *Laelio-Cattleya eximia*, 16 guineas; *Laelio-Cattleya Pallas superba*, 40 guineas; *Cattleya Mendeli*, Quorn House variety, 45 guineas; *Cattleya Mossiæ Wagneri*, 20 guineas; *Laelio-Cattleya Belia*, 44 guineas; with *Cypripedium callosum Sanderæ* (fig. 99) at the top of the tree, with 130 guineas. There were many others with proportionate prices, but these will be sufficient indication of the rates that prevailed.

LELIOPSIS DOMINGENSIS.

This species is not at all well known, but if sufficient plants of it were forthcoming, it would probably be grown to fill the blank after the *Laelia anceps* varieties are over. In habit it is very like some of the Mexican *Lælias*, and is nearly related to them botanically. The flowers occur on slender scapes a foot or so in length, and are, for the most part, a pretty rosy mauve or purple. It likes rather more heat than the plants named above, thriving best in well-drained baskets or pans in the lightest and warmest part of the *Cattleya* house. During the growing season abundant moisture is needed, but much less when at rest.

LELIA MAJALIS.

This is a most beautiful plant when well grown and flowered, but it is the exception rather than the rule to see really good plants of it. Some growers complain that while the plants grow freely enough no flowers are produced, but this is the fault of the cultivator, as if properly treated no difficulty will be found to get it to flower annually. In my own case the difficulty is that it flowers so strongly that the bulbs get smaller every season after a few years, and eventually the plant flowers itself to death.

After the new pseudo-bulbs are complete soon after midsummer the plant must be taken to the open air for a couple of months to

thoroughly consolidate and ripen them, and no trouble will then be found in getting plenty of flowers. All through the growing season keep the plants well up to the light in the *Cattleya* or the Mexican house, and allow plenty of water when new roots are being produced. Every young lead will then have its flower spike, and as the blossoms in a good form are nearly 6 inches across, bright rosy mauve, the effect on a dwarf plant like this is very fine. Occasionally twin-flowered spikes occur, but they are the exception. *L. majalis* is a native of Mexico, and though one of the first Orchids known to science, was not introduced to this country till 1839.

ONCIDIUM BRUNLEESIANUM.

There is no doubt this pretty species is extremely rare in its native country, for in such a well hunted locality as that around Rio de Janeiro it could not long escape collectors, yet only few plants of it have been sent home since 1879, when the gentleman after whom it

FIG. 99.
CYPRIPEDIUM CALLOSUM SANDERÆ.

is named, Mr. J. Brunlee, of Westminster, sent a piece of it to Professor Reichenbach for identification. It is a curious and handsome plant, and very seldom seen in good condition; indeed, it is not often seen at all.

The flowers are small individually, and occur upon branching panicle racemes. The sepals and petals bend forward almost hood-like over the lip, the side lobes of which in their turn envelop the column, and the front lobe is bright rich maroon, quite an out-of-the-common disposition of colour in this genus. The outer segments are lightly marked with transverse bars of red. There are often dull reddish markings upon the flower peduncles, and the branchlets occur in a distichous manner. It is described rather in detail, as some of our readers may possess a plant of it, in which case we should be glad to see flowers. Weak plants would not, of course, produce large spikes.

ONCIDIUM UNGUICULATUM.

As a showy kind this cannot compete with the nearly allied *O. uigrinum*, but it is a pretty and interesting plant none the less. Instead of the lip being spreading quite from the base, as in the latter, this organ has a long curved claw which gives the flowers a lighter, though less substantial, appearance. It is one of the best growers, and thrives well in rather small pans or pots; if suspended from the roof all the better. A native of Mexico, the plants will thrive in a cool house, and should be well watered when in active growth.—H. R. R.

RICHARDIA (CALLA) ELLIOTTIANA AND C. PENTLANDI.

C. ELLIOTTIANA was exhibited the first time at the Royal Horticultural Society's meeting held on May 13th, 1890, by Captain Elliott of Farnborough, Hants, when it received a first-class certificate from the Floral Committee. It caused quite a sensation by its beautiful golden yellow spathes. It is a greenhouse herbaceous perennial from South Africa, requiring a winter temperature of about 40° to 50°, but it must be allowed to rest during the autumn and winter months by keeping the soil almost dry.

The footstalk of the leaves is from 15 to 20 inches long, more or less mottled with white. The spathe, which is of a very rich and pure yellow, is rolled into a broad trumpet-like tube 4 to 5 inches in diameter at the mouth. Strong tubers only will produce this sized spathes. The spadix is almost concealed within the tube, and is a shade deeper in colour than the spathe.

In February the tubers will commence to show signs of growth, and as they begin to grow potting should start. Shake off all the old soil, and put them in small pots according to the size of tubers, then place them into a warmer temperature of about 55° to 60°, so as to give them a good start. They will root freely, and as the pots become full of roots transfer to larger sizes. A good four-year-old tuber will require a 7 to 8-inch pot before the spathe begins to show. Give plenty of light, and place them near the glass, but shade from the strong rays of the sun. The soil to use in potting should be a mixture of rich fibrous loam, with one-third leaf mould and silver sand or peat added. The pots must be well drained, and some good rough soil put over the crocks.

As a rule the spathe will show itself when the plant is developing its second or third leaf; at first it is quite green, and as it continues growing so it will begin to show signs of colour. In about a fortnight it becomes a beautiful golden yellow, which colour is retained from twelve to fourteen days, when it gradually turns green again, and if impregnated with its own pollen will produce a good crop of seed, which should be sown two to three weeks after being gathered. The freely produced seeds ought to flower in from two to three years. The spathes are never so large on young plants as from tubers from four to five years old. The stock can also be increased by suckers and divisions, which should be done just as they begin to make their fresh roots in spring.

The yellow Arums do not require so much water as *C. aethiopica* or *africana*, neither do they grow so strongly, and consequently require a little more attention, and a warmer temperature when growing. *C. aethiopica* will do well out of doors during the summer months, and grow luxuriantly, for which purpose the yellow kinds have been tried, but with only partial success. They have done fairly well in

a few places, but unless the tubers are strong, and planted or plunged in a very warm border, they will not come to that perfection as under the treatment above suggested.

C. Pentlandi was exhibited by R. White, Esq., of Pentland House, Lee, before the Floral Committee of the Royal Horticultural Society on June 21st, 1892. It requires precisely the same treatment as the preceding. The colour of the spathes is very much the same in both

FIG. 100.—RICHARDIA (CALLA) ELLIOTTIANA.

species, although on some plants it varies, some being a trifle deeper in shade than others. The principal distinction between the two is that the foliage of *C. Pentlandi* is wholly green, and has a broad black band at the base of the spathe. Both species require an intermediate house, and a period of rest during the autumn and winter.

The foregoing description shows how distinct both are from *C. aethiopica* in cultivation and colour. They are a splendid addition to the genus, and most valuable acquisitions to the conservatory and

the greenhouse. No garden, however small, should be without them.
—H. W. G.

[We trust the practical information given by our correspondent will be of service to "D., Deal" (who recently sought for cultural hints) and other readers. For the excellent illustration (fig. 100) of *R. Ellottiana* we are indebted to the courtesy of Messrs. J. Veitch and Sons, Ltd, Chelsea, who showed such a splendid group of those plants at the Drill Hall on May 16th, and at the Temple Show.]

BLOSSOM BUD FORMATION.

As a pendant to the instructive discussion on "pinching fruit trees," we propounded, on page 393, May 11th, the following questions as bearing on the subject, and invited replies from our correspondents. Of those received we publish an instalment, and have others not less interesting to follow.

- 1, What is a blossom bud?
- 2, How is it formed?
- 2, What helps and what hinders its production?
- 4, If, and in what way, a blossom bud can be changed into a growth bud?

Great pressure of work has prevented me from replying earlier to the above questions (page 393), which should supply most of us with food for reflection.

My answer to question 1 is, An arrested growth bud, which contains in the embryo the essential organs of reproduction.

2, The marvellous process by which wood buds are converted into blossom buds is beyond the power of plant physiologists to show us; they can only demonstrate that under certain conditions such changes do take place.

3, This ought to elicit the most useful information, as the observation of all practical cultivators should lead them to form decided opinion on the points raised. Assuming that my definition of "a blossom bud" is correct, it becomes apparent that growth has to be checked—arrested—to secure blossom buds. Under some circumstances this is in favourable seasons brought about by natural conditions, as the moist, mild weather of spring is favourable to growth. Then follow the sunshine and great heat of summer, which checks growth, and solidifies it, a process which we term wood ripening, and which we know causes blossom bud formation. When, however, we have wet comparatively sunless summers, growth continues for a longer time, not being checked by sunshine and a dry atmosphere, the wood then fails to ripen properly, and the effect is seen in a scanty show of blossom the following season, or at least a dearth of vigorous fully developed ones. One of the greatest aids to blossom bud formation is then clearly to keep the shoots thinly disposed, so that whatever the weather may be every leaf and shoot may be fully exposed, and thus become hardened—checked—in due proportion to the amount of sunshine we get. By pinching a shoot in summer we check it for a time, but also cause it to start into growth again, and during the time active growth is taking place the process of sap elaboration and blossom bud formation is to a certain extent delayed, for the natural conditions under which fruitful wood is produced are completed—growth first, then wood ripening. In the case of trees trained on the restrictive system pinching is no doubt necessary to prevent the shoots becoming crowded to the exclusion of sun and air, but this only shows that Nature will do the whole thing for us if we allow trees plenty of room, and thin the branches thoroughly. Other aids to blossom bud formation are root-pruning and shortening but little at the winter pruning, as hard pruning results in a thicket of strong shoots unless root-pruning is practised in conjunction with it. Blossom bud formation is also aided by budding on dwarfing stocks, and in the case of trees worked on the Crab, planting very firmly in soil not over-rich.

4, A fully developed blossom bud cannot be changed into a growth bud, but during the transitory state absence of sunshine, combined with a vigorous flow of sap, may prevent the formation of a perfect flower bud. Something else may also happen which many might take to be the changing of a flower bud to a wood bud. Examine an Apple branch in early spring; at the base of a blossom bud may often be seen a small wood bud, which seems to form part of the blossom bud; this bud may drop, or not burst, and leave the tiny wood bud, but no change has taken place in it, it was a separate bud from the first.—H. DUNKIN.

1, THIS question is not so readily answered as may appear. Different plants have different ways of producing blossom buds. A blossom bud of an Apple or Pear tree is specialised growth, containing the essential organs of reproduction, as well as a non-essential envelope which serves as a source of attraction to insects to visit the flower for the purpose of fertilisation. A blossom bud would be really useless if

it did not contain the organs of reproduction, because the functions that they perform are absolutely necessary in order that fruit and seed may be produced for the perpetuation of its kind. In short, then, a blossom bud is a bud specially developed by a plant or tree for the main object of producing seed. The cultivator's object, unlike that of the plant or tree is to produce in a highly developed form the fleshy, succulent, and protective covering in which the seed is enclosed.

2, A blossom bud is formed by the elaboration, in a highly perfected condition, of the materials taken in by the plants in the shape of soluble food absorbed by the roots from the soil and gaseous food taken in by the leaves from the air. These substances undergo chemical change in the leaves, whence they are transferred to various parts of the plant for the enlargement of the whole. The reserve material is then stored up in buds for future growth, and under the most favourable conditions, a certain amount having become more highly perfected, is built up only into blossom buds.

3, The production of a blossom bud is helped chiefly by the full exposure of shoots to sun and air, so that the work of the leaves may be carried out under the best conditions. It is also important that a due supply of nourishment may be obtained by the roots. Under less favourable conditions blossom buds form, owing to a limited supply of nourishment; but if they develop into perfect blossom buds, it is done at the expense of growth buds. A weakly blossom bud will not fully perfect the essential organs. A blossom bud is hindered in forming when the roots are more than usually active in rich soil, which provides a stimulus to continued and vigorous growth; also when the roots of fruit trees descend deeply into the subsoil, stimulating strong and sappy growth.

4, A fully formed blossom bud cannot be changed into a growth bud, because a blossom bud contains only the essential and non-essential organs of the flower. If it fail to fulfil its functions it simply dies, as it contains no provision within itself to form new wood growth.—E. D. S.

NOTES ON FORCED FIGS.

IN order to have early Figs the trees must be of varieties that afford good results in their first crops, such as St. John's, Angélique, Black Provence, Early Violet, and White Ischia, all with small fruit; Black Ischia, Brown Ischia, both with medium sized fruit; Pingo de Mel and Brown Turkey, with large fruit and best for general purposes. The trees must not be neglected or disappointment is inevitable. They should have all the light possible and be kept as near the glass as practicable without touching, so as to secure sturdy well ripened growths, and pinching must not be practised to a late period, otherwise the shoots will not mature sufficiently to carry a first crop of fruit. The foliage should be kept clean, and liquid manure supplied so as to secure stout but not gross growth.

When the growth is complete the trees may be stood outdoors to induce rest, but the wood should be well matured previously, and to be of use for early forcing it must be matured early. The trees should be given a sunny corner, but not dried off, properly syringing and watering, and if the wood be soft the trees should be kept under glass until it is thoroughly ripened.

The second crop now swelling on the current year's wood should be thinned before the fruit is the size of Walnuts, and in thinning reserve the largest fruits at the base of the shoots. The trees require generous treatment; those in pots must be mulched with rich material and supplied with liquid nourishment twice a day in hot weather, and generally once. Trees in borders also require mulching and water or liquid manure once or twice a week, according to the extent of the rooting area; others may require it less frequently on account of their vigour, always being guided by circumstances and actual requirements. Syringing will be needed twice a day to keep red spider in check, and, if necessary, apply an insecticide, removing scale with a brush.

The fruit now ripening in succession houses must be kept from damp throughout the whole of the process, affording a free circulation of warm, dry air, and a night temperature of 60° to 65°, 70° to 75° by day, and with sun heat, 80° to 90°. Figs ripened in a close moist atmosphere and in shade are insipid, but those perfected in full exposure to light and a favourable atmosphere are wholesome and nutritious. If a circulation of air be afforded constantly there will be little danger of "spot," but if it should appear promptly remove the affected fruit and burn it, also, as a safeguard, use a little sulphur on the hot-water pipes. This is also hateful to red spider, the fumes given off having a deterrent effect. In bad cases it is advisable to gather the fruit closely and give a good syringing, which is still the best means of keeping down red spider, and the water will not injure the fruit, provided it is clear and soft and the operation done early on a fine day. Although a somewhat dry atmosphere is desirable when the fruit is ripening, it must not be arid, or the foliage will suffer, and moderate moisture will not damage the fruit, provided a circulation of air is maintained and the ripening Figs are not wetted.

Trees swelling their crops will require syringing twice a day, copious supplies of water or liquid manure at the roots, and a genial atmosphere. Afford the fruit the benefit of all the light practicable, tying in and regulating the shoots by thinning and stopping.—GROWER.

INCURVED AND REFLEXED JAPANESE CHRYSANTHEMUMS.

I DO not at all share in Mr. Molyneux's fear (page 402) that the classes for twelve incurved Japanese and twelve reflexed Japanese, which are in the present year's schedule of the Kingston Chrysanthemum Society, will be failures. So far as the incurved one is concerned it has for several years been a popular class at Guildford, no difficulty being found in filling it. But for one incurved Jap there are several of expanded, or reflexed character, and to fill the class for twelve reflexed flowers would be very easy. Why, the Carnots and V. Morels alone can half fill the boxes.

As to incurved, how many fine flowers there are practically in true form incurved, some really more so than are the stiff petalled ones that are labelled as ordinary incurved by the N.C.S., to make up a good class with. Every grower knows them, and no doubt there are many who, not caring for the ordinary incurved, even though now largely composed of semi-Japanese, will be pleased to enter into a class that admits N.C.S. Jubilee, Robert Owen, Australie, and many others too numerous to mention.

As to determining whether a variety is when shown an incurved or a reflexed, I take it for granted the judges will be sufficiently intelligent to determine that on the merits of the flowers before them. If Mr. Molyneux's fine namesake throws a good incurved flower, let it be shown as such. If it throws a fully expanded, or reflexed flower, let it be so staged. Judges really have to deal with flowers, and so long as the dozen in the boxes are distinct, I do not see, provided the blooms are what are asked for, that any trouble in making the awards need arise.—A. D.

THE FINAL POTTING.

THIS, the most important of the many necessary operations in the culture of Chrysanthemums, is not always carried out just at the right time or in the best manner. Endeavour, however, should be made to place the plants in their flowering pots as soon after the pots begin to be filled with roots as possible. It is to the advantage both of the cultivator and the plants, which certainly appreciate the extended root room, showing it by increased vigour of growth and larger, more ruggedly healthful leaves.

There are more causes than mere neglect which prevent Chrysanthemums being potted immediately they are ready, and every cultivator does not always find it convenient to carry out the work at the proper time. The next best thing must then be done, and that is give increased attention to the plants while they remain in the small pots, affording additional sustenance for maintaining their vigour. The best way to do this is to afford supplies of weak liquid manure, or slight dressings of some approved fertiliser. This cannot, however, be carried on for long, and will render the final potting more than ever imperative.

During the time plants are growing or waiting for the final potting the compost for them may be prepared, though the longer period beforehand this is done the better, so that all the materials used may be well incorporated.

Those who have still to prepare their compost may do so in the following manner. Half-decayed turf should be chopped up into pieces the size of Walnuts, when in a moist state. To four parts of the turfy material add one part of decomposed manure; either cow or horse manure will suffice. Very heavy or retentive soil may have one part leaf soil added, but to light soil it is better omitted. Half a part of sand, charcoal, and wood ashes, and a similar quantity of bone meal might be mixed in. Turn the whole over several times, and to every bushel add a pound of Clay's, Standen's, or Thomson's manure. These are good general fertilisers, and either will prove beneficial. Turn the material as often as possible before potting.

Clean pots ought to be prepared and the sizes apportioned to the plants. From 7-inch to 10-inch are the best sizes, and these will accommodate plants growing in 4-inch to 6-inch pots. Crock the pots carefully, not using more than absolutely is necessary, and cover with rough parts of the compost. Take special care that the plants are moist at the roots before placing them in their flowering pots, but they must not be very wet. Where very much root-bound loosen some of the roots round the ball and pot firmly. In nearly every case the soil must be worked down very firmly by ramming, but judgment must be used in doing this, as it is possible in using some soils to make the compost too firm.

Place a long stick to each plant as the potting proceeds, and stand the plants close together on a moist base of ashes. Water carefully, and syringe every day.—S., Carshalton.

ABOUT RHUBARB.

HAVING been now for nearly thirty years experimenting with Rhubarbs, and having in that time had through my hands the bulk of the known varieties, I could but admire the soundness of the advice given to a correspondent on page 478 as to the two varieties you recommend your correspondent to grow—namely, Hawkes' Champagne for early work, and Victoria for the main market crop. "W. B." will not go far wrong if he has these two varieties.

In Rhubarb growing as in all other garden crops, the grower has first and foremost to ask himself the question, "What do I want? What are my requirements as to either market supply, or to satisfy the demands of the household that I cater for?" The settlement of that question can only be made by the grower himself. He can, and wisely does, get the opinions of those capable of instructing him by asking some such question as the one referred to, but when he has got that, it is manifestly expedient that he not only gets the varieties recommended him, and then afterwards to go on to secure as best he can other known varieties in order that he may prove for himself whether any of these will give him in a higher degree the qualities he requires in his Rhubarb or other garden crops.

I was driven to my experiments in Rhubarbs by three things. I wanted the earliest, the reddest coloured, and the sweetest flavoured Rhubarb I could get. Maincrop and forcing Rhubarb did not enter my experiment, except incidentally, and that I had at the time of my first experiment in Victoria which I now use only for jam making, or for vinegar or wine, and forcing. For forcing there is no Rhubarb to equal it. I therefore keep it chiefly for this purpose, and grow it largely on a three-years course of cultivation; that is, I make a plantation every year, taking up each third-year plantation to put into the Mushroom house in relays of roots for the winter's supply. The result of my requirements on my experiments have caused me to reduce my stock to a few varieties which so far satisfy my demands. Chiswick Early Red, the very earliest, Hawkes' Champagne, and Lister's Cherry Red as the main summer supply. Hawkes' in greatest quantity, though I cannot part with Cherry Red, because, if a little later than Hawkes', of its colour and most refined flavour. Then there are a few roots of Salt's Crimson Perfection by request of one of my principals, for its high colour, and, as I said, Victoria for late domestic use and forcing.

As, however, I have not entirely lost my Rhubarb enthusiasms, I have this season entered upon another trial, or experiment, of varieties, which I shall report on, if all is well with me, in due time, but not till after a second year's growth. I have made my experimental plantation of old and new (to me) varieties on one border, planting the varieties in lines, side by side, in the following manner:—

- 1, Lister's Cherry Red;
- 2, Baldry's Scarlet Defiance (from our friend "N. N.");
- 3, Hawkes' Champagne;
- 4, Chiswick Early Red;
- 5, Seedling from Stuart & Mein's Kelso;
- 6, The Sutton (direct from Reading); and
- 7, Kelway's Crimson Queen.

I shall watch the growth and characteristics of these all through the season, and make notes for future guidance and judgment.

"A. D.," page 385, puts in a plea, in his note on Rhubarb, for the more general raising of plants from seed, "less dependance being placed on divided plants and old stocks." Personally I have not done any raising of Rhubarb from seed, but it was my privilege some few years ago to have a friend a market gardener and nurseryman, who for a succession of years raised his forcing stock from seed, lifting them, after the second and third year's growth, according to their strength and fitness, for forcing. I had the pleasure of inspecting the crop year by year, examining each line of roots carefully to see if I could find one that was worthy of preservation as a standard variety, but in all those years I am compelled to say that I did not find one with qualities superior to known varieties. There was running through each year's crop a monotonous level of what I may call decent mediocrity. As a rule they ran on the lines of the old varieties Linnæus and Victoria. Here and there there would be a few roots or stools which showed some little variation, but none of conspicuous excellence, and as my standard was high, and my three points of earliness, colour, and flavour not satisfied, I left them to their fate—to be lifted for forcing, and then cast aside.

"A. D." seems to think that only at Chiswick is there a good collection of Rhubarbs. I do not dispute this absolutely, because he travels about more than I do, and sees more gardens in one year than I do in ten; but there are a few gardeners up and down the country who take a great interest in this fruity esculent. The late Mr. Richard Gilbert, of Burghley, was one. It was from him I had my true strain of Hawkes' Champagne, and we have had positive evidence lately that our good friend "N. N." is enthusiastically interested in Baldry's Scarlet Defiance, and it appears from "A. D.'s" note that Mr. G. Wythes is a Rhubarb man, as he showed at the Drill Hall, on the 2nd inst., a seedling variety of some excellence from Victoria. If this

variety is a cross between Hawkes' Champagne and Victoria, with some of the good qualities of both parents in it, then it will be an acquisition indeed, and we that are Rhubarb enthusiasts, will be on the look out for it in some nurserymen's catalogue.—N. H. P.

THE LATE MR. JAMES KELWAY.

I TRUST I may be allowed to join with others in expressing my regret on hearing of the death of this eminent horticulturist, and, as our first personal acquaintance was made under very peculiar circumstances, it may be worth relating.

In the year 1872 I was gardener at Killermont, Glasgow, and a member of the Committee of the Glasgow and West of Scotland Horticultural Society, under whose auspices we had determined to hold a grand International Horticultural Show. Among the exhibitors was the late Mr. James Kelway; he was then working very hard in going the rounds of all the principal shows and receiving consignments of his well-known Gladioli blooms from home.

It so happened that he came to Glasgow from Ireland, and in consequence of the rough weather the boat was so late that when he arrived at our show he found the arrangements complete and the judging in that department over. Mr. Eadie, one of the Stewards, came to me and said, "Mr. O., I wish you would come to my tent, as there is an Englishman there with some splendid Gladioli, but he is too late, also he is so excited I can do no good with him." I replied, "Take my duties here and I will soon put him right." I found him as described, and as the delay was caused through no fault of his own, as he could not control the seas, room was at once provided for his exhibit. I next had a consultation with other members of the Committee, and we decided to call in the Judges again and leave it in their hands to do what was right to him as an exhibitor and to us as being financially responsible, and when I mention the names of Mr. Turner, Slough; Mr. Downie, Edinburgh; and Mr. Paul, Paisley, all of world-wide reputation, it will at once be understood that nothing but justice would be administered. The result was an equal first prize together with a number of first class certificates of merit to individual varieties. Thus the rough was made smooth to the satisfaction of all.

After this episode Mr. Kelway never failed to tell me he "never received greater kindness in his life than at Glasgow." Thus was a friendship founded and remained to his dying day. Many were the pressing invitations I received to pay him a visit, and some years ago, on having business in Yeovil, I did so. Never shall I forget the pains he took to explain to me everything he had on hand, and above all things his career through life. With joy and delight he showed me the cottage and the small piece of ground where he started business first, adding, "I and my wife looked at this nice cottage and garden with longing eyes before we were married, and what a remarkable thing that we should ultimately buy it to be our first place of starting business." Comparatively speaking, it was an infant then, but the property made leaps and bounds, and grew into a business of elephantine dimensions. Such is the reward of thrift or industry, careful thought and economy.

To those who are young and starting in life I would say, "Let the memory of Mr. Kelway be indelibly imprinted on your mind; never forget that he started life as a young gardener, and by his own industry built for himself a world-wide reputation, and a magnificent business for his posterity; also remember that some field of prosperity is open to you if you will proceed on the same lines of diligence and prudence, and make the best of opportunities."

With all due reverence we will pay a tribute of respect to our departed friend—the good and worthy James Kelway.—J. OLLERHEAD, *The Gardener Brickmaker*.

TOMATO WINTER BEAUTY.

WHY should "Market Grower" seek to deprecate the usefulness of the fruits of this Tomato by referring to them as "big?" The fruits were not big, neither have I said so. Really the fruits were of excellent market size, and if they look large in the picture that is because the camera tends to exaggerate size. Then this critic states that if the plants had been shown a fortnight or three weeks earlier he would have been better pleased. The Committee judged of the merits of the variety from the fruits shown, from the photograph sent, which exhibited not a portion, but the entire house, and from evidence given by a member of the Committee, who had just previously seen 300 of the plants as presented in the picture in fruit. But "Market Grower" forgets that Mr. Mortimer did have fruits before the Committee a fortnight earlier, when he showed some half hundredweight, which then greatly impressed the Committee. Grown beside Conqueror in the same house the latter was not nearly so good or so early; indeed the display of fruit made by Winter Beauty was not at all done justice to by the photograph, as for the time of year it was quite unique. Then so good were the fruits that they easily obtained the highest prices in the market. Tomatoes presented as winter fruiters, such as Winter Beauty, cannot be grown and tested as such at Chiswick. As its name implies, the variety, which is of dwarf short-jointed habit, is specially regarded as a winter and early spring variety, and that it is such, and a first-class one for the purpose there can be no doubt.—A. D.

It may be, and no doubt is, quite true that the fruits of Tomato Winter Beauty, which secured for the variety an award of merit, were estimated by "provincial judges," as we are editorially informed on

page 435 last week, that this does not meet the real question of a "Market Grower." The point of his remarks lay in the implication that the Committee had infringed their own rule in granting an award to gathered fruits alone and without having seen plants in bearing.

If I mistake not, a rule was made, and acted on time after time, that awards should not be made from fruits alone, either of Tomatoes or Cucumbers, as so much depended on the habit and productiveness of the plants that afforded them, for determining the real merit of a new variety. That is what might be expected from a practical body of men; and is it not a fact that awards have been refused until fruiting plants have either been seen growing at Chiswick in the summer or brought and placed on the Committee table by their cultivators during the winter or spring when plants are not forced into bearing in the R.H.S. Gardens? Have not plants, both of Tomatoes and Cucumbers, been brought to the Drill Hall in accordance with the rule in question before the Committee would make any award, however handsome the fruits that had been previously submitted? If this be so, why the "departure" of which a "Market Grower" reasonably complains?

One thing tolerably certain is this—If an impression is conveyed to the public that exceptions are made in the established methods of dealing with products exhibited, and that the evidence of photographs is admitted as valid, the trust reposed in the Committee is bound to be diminished. The Tomato alluded to may or may not be the best in the world. That is not the question, and a "Market Grower" weakened his own case by his method of treatment and his peculiar, not to say swaggering, reference to the "provinces."—AN INTERESTED PROVINCIAL.

TAR WATER AND LEAF MINERS.

As there has been some inquiry about the use of tar water as a remedy for attacks of leaf miners, I send you a leaflet on the subject, published by the Department of Agriculture in New Zealand. It may be well to make it known that the half pound of gas tar is boiled in 1 gallon of water for twenty minutes, and while *boiling hard* the contents of the boiler is turned out into a vessel containing 50 gallons of cold water. Stir thoroughly, then spray the plants. Most insects dislike the smell of tar, and will get away if possible. This has proved effectual in protecting Chrysanthemums, Cinerarias, and Marguerites from the leaf miner, and Cabbages from the diamond-backed moth.—E. LUCKHURST.

The leaflet, written by Mr. T. W. Kirk, Government Biologist, is most interesting, as well as instructive, and we therefore reprint it for the benefit of our readers.

In 1894 I suggested the use of tar water for this troublesome pest, which damages so many garden and greenhouse plants, pointing out that "tar is obnoxious to all insects, and they will get away from it if possible." The way to prepare the tar water is half pound coal tar boiled in 1 gallon of water, and when boiled for some time diluted with 50 gallons of fresh cold water. When writing the article referred to (in 1894) I mentioned that in Europe a small Ichneumon fly helps to keep the miner in check, but that it had not been seen here yet. Last year (1897) Capt. Brown reported its discovery in Auckland, and soon after I bred specimens here, but in this district it does not make any appreciable difference. The following extracts from letters of a correspondent, a practical gardener, well known to all horticulturists in Wellington, will show the efficacy of the remedy advocated.—T. W. KIRK.

"The Grange, Wadestown, 31st October 1896.

"I would like to tell you my experience with your tar remedy for leaf miner on Cinerarias. I grow a good batch of them here, and last year I followed your directions for using tar as a preventive of the miners' depredations. I sprayed perhaps about half a dozen times, and during the whole growing season I was unable to find a miner on the plants. This year I tried the difference. I have trusted to hunting them, with the result that many of my plants were quite spoiled, and every one was more or less disfigured. The hunting business not only required more time than I could afford, but even when found the insects had already done more or less harm, so in future I will pin my faith on your tar.—Faithfully yours, W. H. TAYLOR."

"Wadestown, 9th September, 1897.

"Some time ago we had a talk *re* Cineraria miner. I told you then that I had tried your tar remedy with satisfactory results. I now report to you result of further trial, and will review my past experience. I used the remedy first in 1895, and had not a single leaf injured until the plants were in full flower, when, owing to the plants being surrounded by other flowering plants, I was unable to use the tar water, then I had plenty of the miner. Some of my gardening acquaintances were sceptical as to the efficacy of the remedy, suggesting that I would have been free from the pest in any case. I could only say that plenty of the insects could be found on the Thistles all over our place, and could therefore see no reason why I should enjoy immunity more than others. Last season, with a view to testing the question, I made no use of the tar water, and before this time was picking off the riddled leaves. This season I have used it again, and up to this date have not seen a single, solitary miner on my plants, about eight in number, though at least two growers have to my knowledge had their plants quite ruined by them, and I saw it on one man's plants about three months ago. When I use the tar water I syringe the glass, staging, and floor of the house mainly, giving the plants a light dose. I do not see how an experiment could be more complete than mine has been, and I am quite satisfied.—Yours faithfully, W. H. TAYLOR."

INCARVILLEA DELAVAYI.

ABOUT a week ago I paid my first visit to the gardens of Gunnersbury House, and, under the guidance of Mr. James Hudson, saw many plants, flowers, and fruits of interest. Foremost amongst them must be placed *Incarvillea Delavayi*, of which a couple of plants in one of the cool houses were flowering splendidly. Its *Gloxinia* like flowers (fig. 101) were singularly attractive, and it is a matter of surprise to me that it is not far more generally grown, especially when the fact that it is almost hardy in our gardens is taken into consideration. The colour is rose to rose pink, the throat being soft yellow. In the latest edition of Robinson's "Flower Garden" the author says:—"Incarvillea Delavayi has lately come from China, and has proved hardy, Mr. Thompson, of Ipswich, writing that it has been a year or more in the open border, having stood the full brunt of a zero temperature. . . . Where it is not happy out of doors it is worth growing in the greenhouse."—WANDERER.

BATH AND WEST, AND SOUTHERN COUNTIES SHOW, EXETER, MAY 24TH.

PERHAPS the unhappy Londoner went home on Whit-Monday (if he went out) thoroughly convinced that no joys remained for him! Had he come down to green Devon he would have enjoyed lovely weather—that is, if he had not stayed until this great show. Those who ventured out on Wednesday morning ought to be credited with good-will to the success of this useful show. All Wednesday morning rain fell heavily, completely saturating the beautiful park-like meadows in which the show was held. Thin shoes and thick shoes alike seemed to get thoroughly sodden. Towards tea-time things began to look a little better, but not very much.

I found that the best place of refuge was within the magnificent tent devoted to the horticultural section. Just inside, on the right (under the ridge of the tent), was a well arranged collection of plants from Messrs. Wm. Cutbush & Son of Highgate. Carnations were specially represented, among others being *Duchess of Fife*, *G. B. Bryant*, *Gen. Stewart*, *Leonard* (new), *La Vilette*, and *Germania*. A long stretch of ground next to Messrs. Cutbush's collection was occupied with well grown plants from B. H. Hill, Esq., Newcombes, Crediton, whose gardener, Mr. G. Lock, filled the space allotted to him with excellent judgment. *Acalypha hispida* (Sanderi) was well shown by Messrs. R. Veitch & Son, Exeter, and Messrs. Cutbush & Son. The next stage was filled with plants from Messrs. Paul & Son, Cheshunt, including some choice *Hippeastrums* and *Roses*, comprising *R. G. S. Crawford*, the new *Teas Sunrise* and *Dawn*, the latter a very showy *Rose*, single or semi-double flowered.

At the other end of these groups stood the splendid plants from Parker's Well, Exeter, belonging to W. Brock, Esq., whose gardener (an Eastern Counties man), Mr. W. Rowlands, has been so successful as a prizetaker in arranging plants for effect. He had done his best, on this depressing occasion, to make visitors appreciate the beauty of the choice stove and greenhouse flowering plants. Coming round the south end of the middle of the tent, on the west side, visitors soon found that Exmouth, the place of grand sunsets and health restoration, was represented by Mr. W. J. Godfrey. *Pelargonium Regina Victoria* is one of the finest whites ever introduced, with a light crimson feather on the upper petals; the flower is large, of perfect form, and beautifully fringed at the margin; *Emanuel Tias*, a *Regal*, somewhat like *Madame Thibaut*, but double the size, both in bloom and truss, whilst the flower is fuller, better frilled, and of much richer colour; and *Duchess of York*, silver tricolor, a dwarf, prettily marked variety, that will be sought after. Not only at this stand, but on others, were some fine double *Lilacs*. There were also *Oriental Poppies*, including *Exmouth Gem*, deep crimson grey, and *A. W. Chiltery*, palest flesh, a large handsome bloom.

At the extreme south end of the tent Messrs. R. Veitch & Son, Royal Nurseries, Exeter, had laid out one of their now well-known waterfall gardens, arranged by Mr. F. W. Meyer, the firm's landscape gardener. "A very clever man," was the remark that we heard a gentleman make (and he has travelled a good deal), as he turned away from the sight of this "rock garden"—natural-looking rock jutting out among grass-covered banks. The water trickled down among the plants, making them happy and prosperous, and led to another pond containing plants of a different class, then disappeared under the rocks. The charming golden *Arum*, *Richardia Elliottiana*, was, to some persons, the most pleasing, while the *Transvaal Daisy*, *Dimorphotheca Eckloni* (lately introduced), with flowers white inside and blue without, gave a fine appearance to the arrangement.

Messrs. John Laing & Sons showed well grown plants, as usual, and filled about 30 feet by 8 feet. Messrs. B. Brown & Sons, St. Thomas, Exeter, had a very gay stand, but rather crowded; but Miss Brown minimised this little oversight by her very choice bouquets, baskets of flowers, wreaths and crosses. Messrs. G. Cooling & Sons, Bath, showed some choice *Clematis* plants in pots, and also cut *Roses*.

Some well constructed span-roof portable greenhouses and frames, glazed with Harding's patent zinc bar, and fitted with simultaneous openings, were on the ground, as well as many fancy pots, tiles, summer-houses. But alas! who could take orders on such a day? While this is being written (25th) the wind is blowing from N.E., and we are looking for fine weather, although we have no sunshine. Those who love rock-work would do well to visit this charming county, in many parts of which rockwork is seen in all its beauty, and in some places in all its ruggedness.—A LOOKER ON.

TAMWORTH PANSY AND VIOLA SHOW.

MAY 24TH.

ON the present occasion this popular show was held in Tamworth Castle grounds, the idea being that the show would be rendered additionally attractive by selecting the venue in question, on account of its having been recently (May 22nd) opened, and dedicated to the public by the Earl of Dartmouth, Lord Lieutenant of Staffordshire. This historic and picturesque ancient castle was acquired in 1897 by the Corporation from the Marquis of Townshend, in commemoration of the Queen's Diamond Jubilee. Tradition says that the town and castle were burnt by the Danes in 911, and rebuilt in 913 by Ethelfreda, daughter of Alfred the Great, and last of the Mercian queens. It was a castle of the Saxon king, and was afterwards held by the Marmions, Frevilles, Ferrers, and other families.

The edifice crowns a knoll—the latter supposed to be of artificial construction 130 feet high—and in its noble round keep is a room where Mary Queen of Scots was a prisoner. The walls and fireplaces of its

FIG. 101.—INCARVILLEA DELAVAYI.

principal apartments are enriched by very old oak panellings and carvings, amongst which exists an interesting chimney-piece in oak, said to have been carved by French soldiers during the time of their imprisonment.

The Castle and its grounds occupy about three acres of ground, and the tall trees surrounding a portion of the Castle mound are laid under contribution by a colony of rooks. A few very old and decaying English Elms are still existent in the grounds, and it was near the chief entrance that the Pansy Show was held, and notwithstanding the unpropitious weather a satisfactory "gate" receipt rewarded the Committee for their selection of the site. The exhibits were numerically considerably below those of previous shows, owing partly to the comparatively adverse season. Lack of quantity, however, was compensated for by quality, more especially in the *Viola* classes.

The chief exhibitor of Fancy Pansies was Mr. T. Naden, Derby, and he was worthily awarded the first prize for twenty-four blooms, dissimilar (open to all, including trade growers), comprising such varieties as *Col. M. R. G. Buchanan*, *Mrs. C. Lambie*, *Maggie Watson* (excellent), *R. C. Allan*, *David Gold Mackay*, *Felicia*, *Attraction*, *Victoria* (very fine), *Provost White*, *Maggie Bell*, *W. H. Clarke*, *Mrs. Bond*, *Mrs. R. G. Moir*, *John Mackie*, *Tamworth Yellow*, *Tom Watters*, *George Stuart*, *Mrs. W. Steele*, *Alice Russell*, *Mrs. D. Johnstone*, *Mathew Alexander*, *Mrs. Proben*, and *Tamworth Herald*. In the class of twelve varieties the same exhibitor again enjoyed a "walk over" with a selection from the foregoing varieties. In the classes for amateurs residing south of the Humber, for twenty-four Fancy Pansies, dissimilar, Mr. Naden again claimed first honours as the only exhibitor.

Councillor Waters was well to the front with six sprays of rayless *Violas*, including *Maud*, *Hibernia*, *Mary Stuart*, *Mrs. C. F. Gordon*, *Formidable*, and *Dorothy Tennant*. The same grower secured the premier

position in the following classes: Spray, six blooms, rayless white Viola, with William Tell, very fine; spray, rayless blue Viola, Blue Gown; spray, rayless yellow Viola, Pembroke; spray, rayed white Viola, Blanche; spray, rayed blue Viola, Britannia; spray, rayed yellow Viola, Stephen; and for twenty-four sprays of Violas (dissimilar). For twelve sprays of rayless Violas, distinct, Mr. J. M. Johnstone, The Gardens, Hints Hall, was awarded the first prize. The flowers were tastefully arranged with Maidenhair Fern and Asparagus foliage. The second prize was allotted to Councillor Waters.

In the class for six blooms of Fancy Pansies, one variety, the first prize was awarded to Mr. T. Naden with John MacKie in excellent form and colour; also the first prize for six seedling Fancy Pansies. In the class open to amateurs residing within ten miles of Tamworth Town Hall, Mr. W. B. Fowler was the only representative, and was awarded the first prize for twelve Fancy Pansies. For twelve sprays of Violas, distinct, Councillor Waters was the only exhibitor, and received the first prize. In the cottagers' classes Messrs. J. Pavie, W. B. Fowler, Chapman, and Shears were the exhibitors of creditable productions.

There was a very attractive display of non competitive exhibits. Mr. W. Sydenham was awarded a silver medal for a splendid collection of Violas in about fifty varieties arranged in sprays, and it is questionable if a better stand has ever been seen elsewhere. Two new varieties raised by the exhibitor were selected for special awards (F.C.C.). Lark (1899) a beautifully formed flower, creamy white with a heliotrope coloured border, a perfect rayless flower, and one of the best for exhibition; Mr. Sculthorpe, also new, a splendid rayless flower of a rich yellow colour in the way of Pembroke. Other noticeable varieties were Golden Bee, Kingcup, Melampus, Symphony, Sidney, Ethel Hare, Auricula, Bouncer, Kathleen, Marblehead, Thunderer, Mrs. A. D. Parker, and Minnie Warren. A certificate of merit was adjudged to Mr. Sydenham for floral decorations, amongst which was a harp shaped arrangement of exquisite beauty, the framework being composed of Violas Blanche and Sweet Lavender, while the strings were formed of Tom Thumb, a curious Violette.

Mr. J. M. Johnstone was the first prizewinner for a table decoration, most tastefully arranged with blue and yellow Violas, and Fern and Asparagus foliage. The same exhibitor also secured the first prize for a floral design, composed of white and yellow Violas, forming an arched gateway; also a certificate of merit for a collection of plants, in which some fine Calceolarias were conspicuous. Mr. W. B. Child, Acocks Green, had a large and interesting collection of Alpine plants in flower, including several rare varieties. Mr. Robert Sydenham had examples of rustic table decorations. This exhibit was much admired, being composed of white and pink and Uriah Pike Carnations and Roses, to which a certificate of merit and silver medal were deservedly awarded.

ST. PETERSBURG INTERNATIONAL EXHIBITION.

To bring an exhibition under such a climate and conditions as those of the town of St. Petersburg to a successful issue, requires a considerable amount of tact and an immense amount of energy on the part of the organisers, who, in this particular instance, cannot be too highly praised, although their efforts were not crowned with the greatest success. In an horticultural exhibition of this character—that is to say, held in a part of the globe where the severity of the climate is extreme, and where, up to the eve of the opening, snow on the roadsides and ice on the rivers are still the order of the day, it is easily understood that the great bulk of the exhibits should be foreign produce, the native article being, however, of very good quality, especially when all the cultural difficulties are taken into consideration.

The greatest drawbacks, the stumblingblock in fact of the organisers of such an undertaking, is the slowness and apathy of the officials in the matter of despatching goods entrusted to their care. This has been the cause, in this instance, of many disappointments, as exhibits which had been forwarded in good condition, and which had reached the Russian frontier several days before the date of the show, were exposed so long to the influence of very cold and frosty weather that they arrived at their destination either completely spoilt or so late that they could not take place in the competitions for which they were intended.

Besides the Russian exhibitors some 250 or more continental firms sent their produce. England was very creditably represented by Messrs. J. Veitch & Sons, Ltd., who staged a splendid collection of Nepenthes, Sarracenia, and other carnivorous plants, which were the admiration of all the visitors; although exhibited out of competition this most interesting group received a large gold medal; and also by Messrs. R. Ker & Sons of Liverpool, who contributed about five dozen of their beautiful Amaryllis, showing some splendid tints from pale cream, streaked with red, to the brilliant scarlet and dark crimson colours peculiar to that class of plants; this was awarded a large and a small gold medal; while for their group of new plants Messrs. F. Sander and Co. of St. Albans received two large gold medals.

Among the Continental exhibitors the principal prizewinners were:—Messrs. Moser, Mantin, Lachaume, Compont, Chantrier, Boucher,

Defresne, Delavier, Sallier, Duval, Paillet, Martichon, Peeters, Vincke Dujardin, Massange Le Louvrex, De la Devansaye, Louis De Smet, Croux, Seidel, Hermann Krautz, Max Ziegenbalg, Olberg, Hanisch, and others. We hope next week to give a fuller account of the prizes won by the exhibitors of the various nations that have taken part in that great tournament which was held in the Palais de la Tauride, in which it is said that the fêtes given by Prince Potemkine for the reception of Empress Catherine II. greatly surpassed in magnificence those given previously by Louis XIV., or by his intendant, the great Foutquet, at the Palace of Versailles.

The disposition of an horticultural exhibition at St. Petersburg is totally different and distinct from all we are in the habit of seeing in England, for with the exception of fine specimens of trained fruit trees and of Conifers which were planted outside, and of the Orchids and of the English exhibits, for which well-heated greenhouses had been specially built, all the other exhibits, foliage and flowering plants alike, were located in the vast rooms of the Palace itself, and the general effect of the Show, although of a very imposing nature, was greatly marred by the numerous columns of very large dimensions which form an important feature in this remarkable building.

The groups, taken separately, could, however, be well examined, and there were, besides a quantity of Palms, of decorative quality which appeared to have been sent for disposal more than for show, some remarkably fine groups, such as Rhododendrons in full bloom, Azalea indica and A. mollis, and Roses in pots shown to perfection by Russian exhibitors. It was feared at one time that the Orchids which the Belgian growers had intended for the show would not arrive in time, as they had been delayed at the frontier, but they were fortunately received, and added greatly to the importance of an exhibition such as had never been seen in Russia.

We must here add that Mr. Siesmayer, the able director of the gardens attached to the Palace, was most energetic in helping those of the exhibitors who were in difficulties (and there were many) through the want of knowledge of the native language, and for his kind help he well deserves the thanks of all who have had to apply to him.

It is gratifying to record that the Emperor took special notice of the English exhibits. His Majesty, on the opening day, paid great attention to the group of carnivorous plants, and with the Princess Feodorowna and their suites, was much interested in the peculiarities of the plants, to which Mr. J. H. Veitch, who accompanied them around the group, called attention.

Although this exhibition is a remarkable illustration of what can be done with produce brought from far distant countries, it must be admitted that so far as management is concerned it is anything but satisfactory, for ten days after the jury had started its work the prizes awarded to many exhibitors were not published. For several days jury after jury have had to judge exhibits which either had not arrived in time or which from other causes had been left unjudged. We can, therefore, simply note that Mr. Moser, of Versailles, exhibited a magnificent group of hardy Rhododendrons, large specimens in baskets; that Mr. Croux had a very handsome collection of Conifers; that Mons. Louis Leroy, of Angers, sent fine specimens of Magnolias and of Camellias in pyramidal shape; while Mons. Honoré Defresne and Mons. Bruneau showed well-trained fruit trees. Messrs. G. Vincke Dujardin and De Clercq Van Gysegheem showed also some magnificent Bay trees (standards and pyramidal shaped), such as Belgium only can produce.

Inside the houses the Orchids from France and Belgium attracted most attention. They were those of Messrs. G. Mantin, Peeters, Massange de Louvrex, and G. Vincke Dujardin. A special mention should also be made of the wonderfully fine collection of New Holland plants shown by Mons. E. Bedinghaus of Ghent, comprising Acacias, Eriacas, Eriostemons, Diosmas, Boronias, Chorozemas, Correas, such as are very seldom seen nowadays. The Palms of the Société Anonyme Gantoise were also a remarkable feature. Conspicuous among them were Latania Commersoni, Arecia Ilsemani, Calamus intermedia, Livistonia Jenkensi, a unique specimen of Phoenix Roebelinii, Oneosperma Van Houtteana, and many others equally rare.

Some beautifully flowered Bougainvillea Sanderiana were shown by Mons. J. Sallier of Paris, and the Paris floral decorators, Messrs. Lachaume & Delavier, had also largely contributed by their work to the success of the French section, as did the Syndicate of Primeuristes, who showed some very good examples of Peaches, Cherries, and Melons. Mons. Chantrier had an interesting group of Crotons and Anthuriums. Mons. Martichon of Cannes, Mons. Wagner of Leipzig, and Mons. Max Ziegenbalg of Dresden showed large commercial Palms, while Mons. Seidel of Dresden exhibited a splendid collection of Azalea indica grafted upon Rhododendrons, and also one of dwarf Rhododendrons, which were very attractive, and it is only a matter of regret that even now it is not possible to give the names of the prize-winners at St. Petersburg.

"FAMILIAR WILD FLOWERS."—Rather more than one-third of the total number of parts of this work have now been published, and we find in Nos. 8 and 9 the following twenty plates, executed with the same excellence that characterised the first issue. Bee Orchis, Hemp Nettle, Water Cress, Cherry, Salad Burnet, Marsh Thistle, Teasel, Red-berried Bryony, Wood Loosestrife, Water Avena, Butterfly Orchis, Dewberry, yellow Rocket, Goosegrass, Saw-wort, narrow-leaved Everlasting Pea, yellow Deadnettle and the Stitchwort, tuberous Moschatel, Lambstongue, and Upright Meadow Crowfoot.

THE YOUNG GARDENERS' DOMAIN.

SUMMER BEDDING.

THE last week in May is generally found early enough to commence bedding out, but much depends on the climate of the district. Some flower gardens are bleakly situated, in which case the planting is better left until the first week in June. No time, however, should be lost then in getting the whole of it completed by the middle of the month, as the weather generally becomes hotter about Midsummer's day, and the plants when left in pots demand incessant watering, frequently become stunted, and then do not grow so readily as when they are planted in early June.

If a considerable amount of bedding has to be done, all available hands should be requisitioned, so that it may be quickly finished, and, provided that the soil is in proper condition, a week generally suffices to complete the whole. Where spring bedding is done, the soil in most cases will want enriching, but judgment must be exercised. Wallflowers and Violas impoverish the soil very much.

When the spring plants have finished blooming, they should be promptly removed, and leaf soil and spent Mushroom manure be dug into the ground, and if the soil is dry it must be watered about two days prior to planting. Here again care must be exercised, or the planter will be greatly handicapped. The plants must be thoroughly watered the evening before planting, if the weather is dry, as they turn out of pots and plant better, in a moist state, but, on the other hand, if made too wet, the ball of soil is apt to drop off, and the plant of course is greatly checked. If dry the beds should be well watered after being planted, then Dutch-hoed carefully so that the surface may be loose.

All young gardeners should endeavour to make a tour through the London parks every year about the beginning of August, as the beds there are objects of great beauty, and of a style not met with in the majority of private establishments. Personally, I have spent many hours near them, taking notes of the different methods adopted in planting. The greatest credit is due to the able superintendent and staff for the admirable and effective display annually made.—FOREMAN X.

NEWLY PLANTED APRICOTS.

THE autumn is undoubtedly the most suitable time for planting fruit trees, and the sooner this operation is performed after the fall of the leaf the greater will be the probability of satisfactory growth in the succeeding spring. In selecting trees the choice should be given to those of perfect shape and with abundant fibrous roots; they must be moderately strong in growth, but not on any account coarsely grown, and tap-rooted, as these lead to considerable disappointment. Every care should be exercised to prevent unnecessary injury to the roots, laying every one out evenly and as near the surface as may be convenient.

The soil must be in a moderately moist condition, but on no account should the trees be planted if the border be really sodden. Good soil must be worked well amongst the roots, treading firmly as the work of rilling in proceeds, and then sufficient water may be given to settle the soil round the roots. Then place over the surface 2 or 3 inches of half-decayed stable manure. Should the weather be very wet, or in the event of sharp frosts, the border will need protecting throughout the winter season, but the branches must only be loosely attached to stakes to prevent them being blown about and broken by the wind.

At the commencement of growth the trees will demand frequent attention; the side shoots may be allowed to attain a length of 15 to 18 inches, pinching the tips out at this stage, leaving them at intervals of 9 or 12 inches along the main branches. There will perhaps be a tendency for one side to outgrow the other, and this must be corrected by stopping and thinning the side growth more freely, and in the weaker parts allowing more freedom of growth. Always encourage the free admission of light and air, as each branch then becomes well ripened and fruitful, and thus fulfils its proper functions.—F. W. G.

FRUIT FORCING.

Cherry House.—The crop generally being now ripe, consideration must be given to keep the fruits fresh so as to prolong the season. Shading will effect that, but it is undesirable where the fruit is not exposed directly to the sun, otherwise it will be necessary to have recourse to it. Only light material, such as hexagon netting, should be used. Free ventilation must be attended to, and in warm weather a sprinkling of the surface of the border in the hottest part of the day will assist in keeping the fruit plump. The roots must not be neglected for water, as dryness is inimical to the foliage, and on the preservation of this in health depends the proper formation of the buds for the ensuing crop of fruit.

Vines.—Where Grapes are hanging afford sufficient water to the inside borders to maintain the soil in a moist condition. No injury will result to the Grapes provided the atmosphere is not stagnant, but air must be given more or less constantly. When the Vines are cleared of

ripe fruit the foliage should be cleansed of dust and red spider, employing tepid water, and if necessary an insecticide, as keeping the foliage clean and healthy to the last is important for aiding the formation of buds for another season. The leaves being fresh and clean keep the laterals in check by pinching.

Houses with the Fruit Swelling.—Although fire heat cannot be dispensed with at night and on dull cold days, much may be done in economising fuel by closing early on fine afternoons. There must be plenty of atmospheric moisture, but avoid a saturated atmosphere by a little ventilation at night, and increasing it early in the morning. A moist atmosphere is essential to the swelling of the berries, and it should be secured without stagnation by damping the floors and borders two or three times a day—in the morning, at closing time, and before nightfall. Do not allow the laterals to grow so as to crowd the principal leaves, but keep them well in hand. Where, however, there is plenty of space they may be allowed to extend, yet not so as to necessitate their removal to a great amount later on. The temperature should be maintained at 65° at night, or a few degrees less on cold nights, 70° to 75° by day, and 80° to 85° from sun heat, allowing an advance to 90° after closing, or early in the afternoon. Due attention must be given to watering, not at stated periods, but always when it is required. Liquid manure or top-dressings of fertilisers will be necessary for the proper swelling of the berries, and for the perfecting of the crops. But remember a large or excessive amount of liquid in a soil does not necessarily imply a corresponding quantity of available plant food, for the measure depends upon the oxidation of the food elements and the degree of this on permeability by air and water.

Houses with the Grapes Ripening.—Allow a constant and liberal supply of warm, rather dry air; but a genial condition of the atmosphere is necessary for the benefit of the foliage, yet the air moisture must not be excessive or stagnant, as it will prejudice the ripening. Do not neglect to supply water at the roots, and if nourishment is given it should be of a sweet nature, or the Grapes may be tainted, as they are with late applications of soot and other organic matter. If a light mulching of sweet short litter be applied, it will tend to sustain the Vines, and to a more equable moisture at the roots. A good heat is necessary to secure the highest quality; indeed, there is no comparison between Grapes that are properly finished in a rather warm and well ventilated atmosphere and those ripened in a low and moist temperature.

Grapes Scalding.—Muscats and other varieties completing the stoning should be carefully watched in hot, bright weather; and in case of scalding air must be admitted more freely, or until the colouring commences. At that period all danger will be past as regards the black varieties; but Muscat of Alexandria will scald when well advanced in colour, and it is necessary in houses glazed with large panes of glass to employ a slight shading, as that of herring netting, over the roof-lights in very bright periods. With Hamburgs and black Grapes generally it is different; they colour best beneath a good spread of foliage, and it is one of the best means of avoiding scalding, provided the supply of air be bountiful by day and a little ventilation left on constantly at the upper part of the house, with a genial warmth in the hot-water pipes, increasing the ventilation very early in the morning. A temperature of 65° to 70° by artificial means suffices, or a little less for Hamburgs.

Late Grapes.—Where the Vines are in flower a constant supply of dry warm air will further a good set of fruit, the temperature being kept at 70° to 75° by artificial means, and rising to 80° or 90° with sun. Thin the berries freely immediately they are set, but this, in the case of the shy setters, must be confined to the removal of the smallest and imperfect berries in the first instance, deferring the general thinning until the properly fertilised berries can be detected by their free swelling. There must not be any deficiency of moisture at the roots or of nourishment, therefore afford liquid manure copiously after the Grapes are thinned and swelling, or a top-dressing may be given of some approved fertiliser, distributing it evenly over the surface, and work in moderately. If the weather be dry and the soil light outside borders will need watering, affording liquid manure or top-dressings of chemical manures if the Vines are not very strong or are carrying a full crop.

Young Vines.—Those in pots for next year's fruiting should be stopped at 8 to 9 feet, that length of leading shoot or cane being sufficient, and the laterals or sub-laterals pinched at one leaf as produced. Supernumeraries in recently planted houses should also have the canes stopped at the points named, the laterals and sub-laterals being closely pinched. This will concentrate the energies of the Vines in the principal leaves and their buds, and is necessary for those intended to fruit next season. The permanent Vines, however, may be allowed to make all the growth there is room for, which should be accelerated by closing the house early on fine afternoons, admitting a little air before night, and increasing it early in the morning of fine days. When young Vines become established they will require abundance of water at the roots, yet avoid making the soil sodden by needless applications, and sprinkle the paths and borders two or three times a day so as to maintain a genial condition of the atmosphere.

BUSINESS ANNOUNCEMENT.—We are informed that for family reasons the business of Mr. J. T. Anderson has been converted into a limited company under the style of James T. Anderson & Sons, Limited. Messrs. D. & E. Caird, who have taken an active part in the management of the business for some years, join the directorate, so there will be no practical change in the conduct or management of the business. Mr. J. T. Anderson will be the managing director.

THE BEE-KEEPER.

INCREASE OF STOCKS.

As the time is rapidly approaching when the majority of the stocks in the apiary will be overflowing with bees, it will be necessary for bee-keepers to decide how many extra colonies are required to bring the apiary to its full strength. If a small increase only is desired, a surplus of honey may also be obtained should the weather be favourable when the honey flow comes. One important fact should always be kept in mind where the honey harvest is chiefly obtained from the white Clover—that only in exceptional seasons is it possible to obtain an increase of stocks as well as a large surplus of honey from a colony, however strong it may appear to be. Our seasons are too short to allow the bees to waste their time and energy in swarming. Hence the reason we so strongly advocate the building up of strong stocks, that will take full advantage of every bright day when the nectar may be obtained from the innumerable open flowers within flight of the apiary.

The plan we have adopted—with complete success when working for an increase as well as a surplus—was to select a given number of hives which were crowded with bees, each colony being headed by a queen reared the previous season. They received similar treatment to those intended for honey production. Instead, however, of providing them with extra frames slightly in advance of their requirements, we usually confined them to ten frames, as from a hive with this amount of breeding space a strong swarm can be obtained. Although a stock may be crowded with bees, and be ready for swarming at an early date, all will depend on the weather whether they swarm or not. If it should be cold and wet, as it has been for several days past in this district (South Yorkshire), feeding must not be neglected, otherwise they will deteriorate even more rapidly than they increased. The first symptom of shortness of stores in a hive at this season is the casting out of the young grubs on to the alighting board. This may be at once stopped by feeding with warm syrup in the evening.

ARTIFICIAL SWARMING.

Instead of waiting for the bees to swarm naturally, artificial swarming must be induced. It, however, requires to be done in quite a different manner when the bees are kept in the modern frame hive from that practised with the straw skep. In the latter case they require drumming similar to driving bees to obtain their honey in the autumn. But with frame hives, it may be termed dividing a stock.

In commencing operations, the first thing to do is to choose a warm, bright day, when numerous bees are on the wing, and it will thus be much easier to find the queen. Remove the coverings from the tops of the frames, using a little smoke to drive the bees down between the frames. The less smoke used the better. If the operator is gentle in his movements, it is surprising how easily bees may be handled at this season if a high temperature prevails.

Lift out the combs, and carefully examine each one until the queen is found. The comb with the queen and the adhering bees should then be placed in an empty hive, another comb with the adhering bees, and a frame of comb foundation, or fully drawn out comb, should be placed alongside, and the division board closed up. If the combs are not well covered shake the bees off another comb from the original hive. The hive containing the queen and bees should then be placed on a separate stand.

Returning to the original stock from which the queen was removed, lift out each frame and slightly notch the bottom edge of the combs containing newly laid eggs; a few holes may with advantage be cut through the combs. At each place a queen cell will be formed. Draw the division board close up to the combs, and ten days afterwards divide the colony into as many nucleus hives as may be required.—AN ENGLISH BEE-KEEPER.

MANCHESTER SHOW.—When our reporter left the Show, a splendid collection of Gloxinias, staged by Mr. John Upton, The Nurseries, Irlam, had not been noticed. As this grower has been successful in improving the Gloxinia, the silver medal awarded by the Council is richly deserved.

DAFFODILS IN MIDLOTHIAN.—In the paragraph dealing with the newer varieties of the great trumpet Daffodils at Valleyfield, it should have read, "A large batch of the dapper J. B. M. Camm, evidently in high favour with Mr. Cowan; beside him, somewhat later in bloom, Mrs. J. B. M., a sweetly-mated pair of relative size not unusual in actual life." Mrs. George Cammell is correct, not Cannell.—A NORTHERN AMATEUR.

TO CORRESPONDENTS

•• All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," 8, Rose Hill Road, Wandsworth, S.W., and NOT to 12, Mitre Court Chambers, Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor. Letters of inquiry must be accompanied by the names and addresses of the writers, but these will neither be published nor disclosed when initials or *nom de plumes* are given for the purpose of replies.

Soil for Grape Growing (Constant Reader).—The proper proportions of the articles named by Mr. Abbey on April 27th, page 324, to make a compost for Grape growing are—five barrowloads of loam, one barrowload each of lime rubbish, charred earth or wood ashes, and horse droppings, and a peck of soot, or one part in ninety-six of the latter to the compost. Thus for any quantity of soil the proportion of soot may readily be ascertained.

Sowing Runner and Dwarf Kidney Beans in Boxes (E. T. H.).—We do not consider that sowing these in boxes and when large enough transplanting to their proper quarters better than sowing the seed in the ground. Sowing in pots and turning out the plants with the balls of roots entire is better practice than the sowing in boxes and transplanting; but the plan is only resorted to for the sake of earliness, not for general crops, which are best sown where the plants are to remain for bearing.

Newly-made Garden Infested with Wireworm (C. G.).—To save the crops we should at once strew rape dust on the ground at the rate of 5 cwt. per acre, 3½ lb. per rod, and follow in the course of a few days with the mixture you have been using—namely, two parts kainit and one part nitrate of soda, both crushed very fine, using 3½ lbs. of the mixture per rod. The rape dust will bring the grubs up to feed, and the other mixture ought to destroy them; at any rate, both mixtures will help the crop. When the land is clear use a dressing forthwith of mustard dross, ½ oz. per square yard, and point-in very lightly. You may crop the land shortly afterwards, there not being any occasion to let the land lie fallow, or only for a few days. The mustard dross, had from the mustard manufacturers, must not be used on growing crops, or in a much less quantity, say, ¼ oz. per square yard.

Diseased Tomato Plant (Grower).—The plant is affected by "drooping" or "sleepy" disease fungus, *Fusarium lycopersici*, which has apparently entered the Tomato plant from within—that is, has gone over in the seed. The root stem and roots are perfectly healthy. But near the first truss of bloom the mycelial hyphæ of the fungus has attained considerable development, extended quite half and in some places three-parts round the stem, easily recognised by the brown colour when cut through. Above this point the fungal hyphæ or mycelium has quite surrounded the stem and cut off the supply of sap to a great extent, thus causing the drooping of the foliage and ultimate collapse of the plant. One of the largest growers of Tomatoes in the country admits little trouble from the disease where lime or basic slag and kainit have been used as preventives. Strengthening the plant by judicious applications of mineral substances to the soil, careful selecting of seeds from healthy plants, rejecting all weaklings in potting, growing sturdily, avoiding too moist and close an atmosphere, appear to be the panacea for this disease.

Mulching Fruit Trees—Grass versus Manure (F. H.).—The mulching with manure is the better practice, and certainly pays in commercial culture after the trees come into bearing and are not made too vigorous by the applications. It supplies the essential elements of nutrition in a steady manner, and favours the abstraction of moisture from the atmosphere, as well as the conservation of water in the soil and near the surface where the roots are situated, or should be, for health and fertility. The grass acts usefully in the same way, but in a less marked degree, as manure. If the trees are vigorous we should certainly prefer the grass to the manure. Indeed, we have used it very extensively for mulching fruit bushes and trees, and found it advantageous in conserving the soil moisture and in supplying humus to the land. It decays and yields nutrient matter, which can be supplemented by dressings of fertilisers—superphosphate and kainit in equal parts, applied in autumn at the rate of 3½ lbs. per rod, and in spring when the buds start, apply nitrate of soda, 1¼ lb. per rod. The superphosphate and kainit mixture may be pointed in along with the remains of the mulching of grass, thus being equal to, or better than a dressing of manure, and the nitrate of soda left on the surface, but applied when this is moist, never when the ground is dry.

Selling Asparagus (J. D.).—Asparagus is usually sold in bundles of 105 heads, but much is sold locally by several growers in bunches of twenty-five heads. Prices in Covent Garden vary every day, according to the character of the produce and the abundance or otherwise of the supply. The figures have recently ranged from 1s. 6d. to 3s. 6d. per bundle.

Peach Leaves Blistered (J. P. L.).—The leaves sent are seriously attacked by the blister fungus, *Erysiphe deformans*. It appears to be induced by torpidity of the sap, as it is almost invariably the most prevalent after a term of cutting winds. Clip off the worst portions and burn them, leaving all green parts of the leaves, and on the return of genial weather the trees will improve.

Orobis hirsutus (H. James, Dorset).—Such is the botanical name of your specimen, which is one of the Bitter Vetches. It is found in several

FIG. 102.—OROBIS HIRSUTUS.

countries of the Levant, appears to have been known in Holland a considerable time before it was introduced into this country about eighty years ago. The flowers (fig 102) are useful for cutting; the colour is blue in the standard and wings, and in the keel white. Almost any ordinary fertile garden soil suits this plant. It grows and flowers freely, and produces abundance of seeds in favourable seasons.

Vine Leaves Warded (A. B.).—The cause of the Vine leaves being warded is a close, moist, and warm atmosphere. Warding may be avoided by judicious ventilation from the Vines bursting into leaf, always avoiding a close and moist atmosphere with a high temperature in the early stages of growth without some air, so as to allow of evaporation from the foliage, and thus prevent what may be termed extravasated sap. In other respects the leaves are perfectly healthy, but the warding prevents the leaves from properly performing their functions, and they mature earlier than would otherwise be the case, and the Vines are weakened.

Shelter for Garden on Sea Coast (Ret Rail).—Of shrubs the best is the Sea Buckthorn (*Hippophae rhamnoides*), as it withstands the fiercest blasts in the most exposed situations, affording excellent shelter, the remarkably twiggy branches sifting and dividing the wind in a remarkable manner. Next to this is the common Elder (*Sambucus nigra*). It grows strongly where its branches are constantly exposed to the saline-laden breeze. As a hedge it forms an excellent wind screen, but it is better allowed to spread, or having two or three lines. As an evergreen Austrian Pine (*Pinus austriaca*) excels all others. It should be planted in a dwarf sturdy condition, at least three lines deep in quincunx order, and then it will give shelter on the most wind-swept situations, and at altitudes up to 750 feet above sea level.

Diseased Gooseberry Shoot (W. C.).—The leaves and berries are attacked by the Gooseberry fungus, *Aecidium grossulariae*, which is rather prevalent and disastrous this year. There is no remedy, but the disease may be prevented spreading by the removal and prompt burning of the attacked leaves and berries. The cluster-cups are ripe and discharging the spores in myriads, hence spraying with sulphide of potassium, 1 oz. to 3 gallons of water, directing the spray upwards so as to reach the under side of the leaves may do good. In the *Journal of Horticulture*, vol. ix., third series, Mr. Graham describes his method of prevention as follows:—"In 1868 and 1869 about one-third of the fruit became blotched very much by this fungus. I gave the ground amongst the bushes a liberal dressing with lime in the autumn, and syringed them over with a compound of alum 1 drachm, tobacco essence 2 drachms, flowers of sulphur half an ounce, common salt three-quarters of an ounce, all mixed in 3 gallons of rain water. This was done twice before the expanding of the leaf, and again as soon as the fruit appeared fairly set. The first destroyed the germs in the soil, and the syringing cleared the bark of its sporules, and my Gooseberry bushes are now free from all traces of the fungus." Do likewise and there may not be any trouble from parasites next year.

Sulphuring Hot-water Pipes in Vinery (Cross).—1, We have known sulphur applied to hot-water pipes heated to 140° shortly after the Vines have been started. 2, "A month after." 3, "Any time up to the flowering period." 4, The practice has "been tried" and not "found to be injurious." 5, There was no difference "with Gros Colman, Alicante, or Muscats." 6, Yes, but not very effectively, as some would refuse to come away; hence there was more or less afterwards of "a continual sulphur atmosphere," and in this the berries did not "rust." 7, "We have not found the sulphuring injurious to the young shoots or leaves in June or July, why should it be so early in the season?" Answer, because the hot-water pipes are never so highly heated in the months named as constantly early in the year, consequently the Vines are not kept indefinitely in "a continual sulphur atmosphere." This is the crucial point—early in the season the hot-water pipes are very seldom below 140°, but very often, and in severe weather, for weeks over 170°, at which sulphur begins to vaporise or give off sulphur fumes proper, and it is these that stifle the insects or fungi, also injure, when in excess, the Vines. That just makes all the difference. A temperature of 140° is not sulphuring, and has not the slightest effect on red spider, so that the Vines would not be clean. We have used sulphur after thinning, therefore the dictum "cannot be done" does not hold. 8, "Lysol" is a preparation from coal tar made in Germany, and corresponds with soluble phenyle, cresoline, creolin, and izal, being modifications of the same substance. It may be obtained through a chemist.

Names of Plants (R. L.).—1, *Anthericum variegatum*; 2, *Nephrolepis exaltata*; 3, send when in flower, possibly *Gloxinia speciosa*; 4, *Dielytra eximia*; 5, *Saxifraga granulata* fl.-pl.; 6, *Hutchinsia alpina*. (C. D. B.).—*Trollius europæus*, the European Gloe Flower. (C. W.).—1, *Cercis siliquastrum*, the Judas Tree; 2, *Paulownia imperialis*; 3, *Aesculus carnea*. (J. C. B.).—The Orchid is a very good form of *Zygopetalum crinitum*. The remainder of your specimens are varieties of *Azalea indica*, which come within the category of florists' flowers. These we do not undertake to name. Send specimens to one of the leading nurserymen, who will name them for you by comparison with the varieties in their collection.

Bedding out plants in variety from 3s. doz.

STUD BABIES.—No. 2.

THE young foal being now upon his legs and with a good notion of feeding, either directly from his mother or indirectly by bottle from a cow, we will consider his life for the next few weeks.

No foal, or indeed any other animal, can thrive among dirt, so it is essential to the well being of both mare and foal that their box should at once be thoroughly cleansed. Attention must be paid to the cleansing of the milk teats, which from natural causes often become objectionable. It can easily be conceived how soon the delicate stomach of a foal may be thrown wrong by the reception with the milk of foreign matter.

Next must be considered the housing of the mare and foal. English spring weather is particularly treacherous, bright sunshine, sharp winds, sleety showers, follow each other in quick succession—in fact, we might say, “extremes meet” even in twenty-four hours. Fresh air and ventilation are required, but no draughts or chills. Early foals cannot expect to be turned out soon, exercise they must have, and if the weather is against a gentle walk round, surely there is on every farm a yard well shedded where exercise is obtainable.

A careful man will gladly give up half an hour just at midday to watching mare and foal out for a stroll. Coddling will not do, and the stable ought to incline to coolness rather than stuffiness. It is a practice now where large studs are housed to run up boxes of wood. We have known several cases where during a severe spell of wintry weather these boxes have been bitterly cold, and the manager has been at his wit's end to know what to do with his mares and young foals. Those foals, however, stand a better chance of a healthy start than others which are recklessly taken out of a very hot close box and exposed to bitter winds and bright suns. They, poor things, are tempted to gallop about a bit, get suddenly chilled and fall ready victims to pneumonia. Be on the watch for the first few days when the foal is turned out, and bring up directly should the sun go in or a heavy shower come on. Like all young animals the foal is very imitative, and will soon try to share with its mother the dry food. See that this dry food is good and suitable. It is a fine thing when young animals begin to “fend” for themselves.

“Weaning time” is a movable feast. So much depends on the constitution of the foal and on its ultimate career. A weakly foal must have its mother's milk as long as possible—that is, taking into consideration her welfare. If a foal be of wonderful pedigree and handsome in shape and size, the owner naturally wants it to excel, and therefore will keep it with its mother, where a less valuable animal would be weaned. Those foals intended for the show yard have the best of good times—a mother solely devoted to them, and all sorts of additional choice food supplied.

Many mares have to resume their daily tasks while their offspring may be yet young. The hours of separation should not be too long, nor should the mare be put to very hard work. She cannot spend her strength two ways. Milk must be generated, and to be good she must not be allowed to get exhausted.

For the same reason it is well to see the mare has access to good water, and that her diet be not rapidly changed. Remember change of diet may easily affect the foal, and bring on obstinate diarrhoea, and diarrhoea once established is bad to get rid of, indeed its ill effects on the intestines is often lifelong.

There are other ailments to which foals are liable, such as joint ill, which is a form of blood poisoning. It may occur when the foal is from a week to a month old, and is usually fatal. Proceeding as it does from dirty condition, it may be classed among the “preventible diseases,” and therefore should not be allowed to exist in a well managed stud. This ailment begins by the entrance of destructive

organisms into the blood vessels which have been broken by accidental tearing of the navel cord from the body of the foal. As long as any such wound exists it should be most carefully dressed with some disinfectant, carbolic oil for choice, and the dressing ought to be attended to at least five or six times daily.

Hernia or rupture is not an uncommon ailment among foals. Although this may not assume serious dimensions, it is as well to call in professional aid at once and have the matter adjusted. The “Vet” will know exactly what to do, and whether it is a case for severe or simple remedies.

We have often been sorry to see the lack of care exercised for foals after they are weaned and during the first winter of their lives. They are too often turned out all the winter on grass with a very insufficient supply of hand food. Winter grass contains little or no nutriment, and how can the poor animal be expected to grow and thrive on an empty stomach. We do not believe in pampering them, that is unnecessary, but a liberal supply of good food pays for itself.

You want bone and muscle and strength for work; all this goes in by the mouth. It is only a short childhood that horses have—that is, the average farm horse, and he must make the best of this growing time if he is to be of any value later on. There is such a thing as going to the other extreme and overdoing the feeding with too much dry corn, which is the occasion of so much fever in the feet. There is a happy mean which men of intelligence will arrive at without much difficulty.

WORK ON THE HOME FARM.

The cold and wet weather is becoming very serious for farmers of arable land. Grass districts may be looking well enough, though even they would do better now with a higher temperature, and no doubt the excess of moisture is in favour of a good crop of hay.

Spring corn is making poor progress; in fact, some fields seem to be progressing backward. Everywhere we hear complaints of the ravages of wireworm, and there has been no chance to use the roller for some time, so the worms pursue their depredations unchecked. Nothing can be done except to roll when possible and wait for warmth to force the young crops out of danger.

Wheats hold their own fairly well considering the wet season, and give much better promise than the Barleys, but there still remains a little weeding to do, as the crops have been too wet to work amongst.

Turnips cannot be got in at all, for the land is so wet that if they were sown they would do no good. All we can do is to possess our souls in patience and hope for a change.

The young Mangold have come up very well, but are at a standstill; a sprinkling of nitrate of soda dredged by hand along the rows of young plants would warm them up and keep them going.

We see farmers trying to get their land ploughed for the Turnip crop, but the horses could not be worse occupied. Surely there is some muck to be got out into hill in a handy situation for carting out and spreading later on. If not, give the poor things a rest.

Potatoes are coming through, and will soon need to be skerried, but not until the land is dry enough, otherwise the horses' feet may do more harm than the skerry will do good. The Iron Age is a capital horse hoe for Potatoes.

The ewes are not clipped yet. We wish they were.

REMARKS.

21st.—A little sun in morning, but a gloomy day; drizzle in evening, rain at night.
 22nd.—Gloomy and humid all day, with drizzle and showers till 1.30 P.M.
 23rd.—Much sunshine, but cloudy at times with slight showers; bright night.
 24th.—Generally cloudy, with frequent sprinkles of rain, and heavy rain at 0.30 P.M.; but occasional sunshine.
 25th.—Slight showers early; overcast till 10 A.M., then fair, with frequent faint sunshine.
 26th.—Sunny at times in morning; overcast afternoon; bright night.
 27th.—Sunny early and at times during the day, but a good deal of cloud.
 The early part of the week warmer, the latter part dull and cool, with a trace of frost on the morning of the 27th.—G. J. SYMONS.

DAHLIAS! DAHLIAS!!

Ware's

UNRIVALLED COLLECTION

We are now Booking Orders for Immediate Delivery.

Special attention is drawn to the two following beautiful
NEW CACTUS VARIETIES for 1899.

Early Orders are solicited as the stock is limited.

E. O. GREENING.—Purple, shaded crimson, medium sized flowers, long and twisted petals; very free flowering; 2½ to 3 feet high. 5/- each.

SYLVIA.—Silvery-lilac shaded rose, splendid shade of colour, wonderfully free blooming, a splendid flower for cutting, lasting very long when cut; flower stem long and stiff; 4 feet in height. 5/- each.

NEW CACTUS DAHLIAS, Vars. of 1898.

Including such sorts as:—ARACHNE, CAPSTAN, FALKA, ISLAND QUEEN, LAVERSTOCK BEAUTY, RUBY, &c. 2/- each

CACTUS DAHLIAS, General Collection.

All the leading varieties. Our selection, 5/- doz.

SINGLE CACTUS DAHLIAS (New Type).

Our selection, 5/- per dozen.

DAHLIAS.—Singles, Pompons, Shows, and Fancies, in great variety. Our selection, 5/- per dozen.

BEGONIAS.

WARE'S GOLD MEDAL and 1st PRIZE STRAIN.
(If required started into growth, an intimation should be given to this effect).

Single—Mixed, 3/- per doz.; 20/- per 100.

„ To colour, 5/- doz.; 32/- per 100.

„ Extra choice, for Conservatory or Exhibition, 9/- and 12/- per doz.; 65/- and 75/- per 100.

„ Named sorts, splendid forms and colours, from 1/6 each.

Double—Mixed, 5/- per doz.; 35/- per 100.

„ To colour, 8/- and 10/- per doz.; 60/- and 80/- 100.

„ Gems for Exhibition, 18/- and 24/- per doz.

„ To name, THE FINEST EVER OFFERED, from 36/- per doz.

DAHLIA CATALOGUE, containing Illustrations of many new sorts, and list of varieties with full descriptions, post free upon application.

N.B.—All Orders amounting to 20/- and upwards when accompanied by cash, are sent Carriage and Packing free.

Orchids

CLEAN HEALTHY PLANTS AT LOW PRICES.

Always worth a visit of inspection. Kindly send for Catalogue.

JAMES CYPHER,
Exotic Nurseries, CHELTENHAM

“SUNPROOF” Shading.

An entirely new Glasshouse Shading, sold in 6d. 1lb. tins, to be washed on the glass with cold water, as if it were soap. Guaranteed to be one-half the price, and to be the only shading in a solid state ready for use without the waste of time and material in being prepared, and to be superior to any other shading. Try it for yourself, and if not entirely satisfactory your money will be returned.

S.M. TREE FASTENERS.—The cheapest and best method of fastening plants and trees to walls. Being made of pure soft lead and not fixed to the nails (like patent wall nails, which when the nails get broken the article is useless), they may be used with ordinary nails for a lifetime. Under 2d. per dozen.

S.M. CLIPS.—To be used in the place of raffia, &c., for tying all plants to stakes, &c. Fastens instantly, and is everlasting, so saves time, trouble, and expense. 1d. doz.

FLOWER GRIP HOLDERS.—The only self-making buttonhole, watertight flower-holder ever invented, and the best for show and other purposes. Price 6d.; ladies', 9d.

IVORINE PLANT LABELS of every Description, guaranteed the cheapest Imperishable Labels, and the wording legible and permanent. Samples free.

WATERPROOF INK, for writing on all kinds of Labels, whether wood or metal. The only ink to stand the outside weather. Price 7d. Bottle.

GARDENER'S FOUNTAIN PEN, filled with the waterproof ink, 1/-.

WORK FOR HOT WEATHER.

GLORIOUS in its uncertainty is the climate of Britain. A fortnight ago bitter laments were heard on all sides respecting the continuous wet, cold, sunless weather experienced throughout the spring. It seemed as if the long-looked-for sunshine and balmy air would never come; but with the advent of June a magical change dispersed all doubts on the point, and we are now enjoying the brilliant sunshine of an “Indian-like summer.” The writer of the short paragraph (page 428) headed “Too Much Rain” is evidently a prophet, for he concluded with the terse sentence, “There is plenty of time yet for sunshine, and soon we may be wishing for some of these refreshing showers.”

This is exactly the state of affairs in many districts at the present moment. Much planting has recently been done in both flower and kitchen gardens, and a refreshing shower would do an immense amount of good in giving the plants a favourable start, and helping forward vegetation generally. A wet winter or spring was sorely needed to thoroughly moisten the soil and replenish springs, which for a long time after the drought of last summer were very low. On well cultivated land established plants and crops are not likely to suffer much should the present hot weather continue; but with the soil moist beneath, and a few showers to moisten the surface, progress would now be particularly rapid, and the time lost through the backwardness of the spring quickly recovered. The good cultivator is, however, always on the alert to help forward his crops by artificial means when natural ones are for a time withheld. There is abundance of work of this description now, and in proportion as the opportunities to do it are grasped will be the degree of success achieved.

In the flower garden one of the most important matters that needs constant attention is the watering of bedding stock which has been planted during the recent tropical weather. Those who are fortunate enough to have a good supply of water laid on, with hose in abundance to conduct it to any point required, will find the work pleasant and

easy to accomplish. A thorough watering as soon as the planting of each bed is accomplished will put matters right for a day or two, with the exception of a sprinkling to freshen the foliage, given each afternoon or evening; but this must not be confounded with the real operation of watering. I always find it better to water thoroughly twice or thrice a week, than to give only a moderate watering each afternoon, for powerful sunshine acting on soil damp on the surface only quickly draws out the reserved moisture beneath.

Stirring the surface of the soil with a hoe the day after watering has been performed is the best plan to adopt to prevent undue evaporation, as a loose surface cannot crack and form so many channels through which moisture escapes, and warmth too. The use of the hoe provides an inexpensive and natural "mulch," which can be practised on a large scale when mulching with other materials would be out of the question. To those who have extensive flower gardens to manage without the conveniences of an adequate water supply, the present is a trying time, for watering on a large scale with the barrel and water-pot is both a slow and laborious business; yet, perforce, it must be done if satisfactory results are to be obtained. Leaf soil and short grass are, however, usually plentiful enough in private gardens, and they can at this season be put to good use by placing a layer 2 or 3 inches in thickness over all flower beds as soon as they have been watered. The time spent in doing this will be more than counterbalanced by the labour saved in watering. In light soils such plants as Calceolarias and tuberous Begonias can seldom be kept in good condition during hot weather unless a mulch of some kind is given.

Abundance of sunshine, and water intelligently applied, are the main factors in producing a brilliant display in the flower garden, especially when Zonal Pelargoniums are largely employed, and I suspect they always will be, though I hope never again to such an extent as to crowd out the many beautiful plants now so freely used. After a cold wet summer Pelargoniums as bedders generally come in for a fair share of condemnation, but they invariably assert their usefulness again during a hot season.

In the kitchen garden every moment that can be spared is well employed in keeping the hoe going between growing crops; weeds are thus checked in their early stages and the foundation laid for keeping free from them throughout the summer. The man who does this, and has also dug deeply and manured liberally during the winter months, feels secure from ordinary drought, for he knows his crops have a reserve store of food, and ample moisture deep down in the soil; the loose surface may be dust dry, but it performs its great work of conserving moisture for the benefit of vegetation.

For ordinary vegetable crops the attention above indicated is all that can usually be given, but for those grown for exhibition purposes a liberal use of water must be made as well, for no matter how wet the spring may have been, abundance of water given in hot weather shows its result in the form of far greater weight of crop per yard. It is easy to understand the importance of a thorough system of irrigation in tropical countries, for with long hot summers there seems to be practically no limit to the weight of crop an acre of land will produce when we find sunshine and water *ad lib.* at the command of vegetation.

There is, however, one other point which must not be overlooked—viz., the importance of giving additional fertilisers when water is freely used, because the operation results in much plant food being washed into the subsoil. In garden practice this is counteracted by watering with liquid manure, or by applying a coating of natural manure and watering through it. Chemical manures used in conjunction with water are, during hot weather, very rapid in their effect. A sprinkling of guano between the rows of an Onion bed, around Peas or Beans, given just before watering, soon shows that the crops like the treatment, but to apply such fertilisers in hot weather and omit to water immediately after, causes great injury, as many roots are burnt, and top growth quickly shows signs of distress.

A vital point for all to remember in hot weather is, Use water as freely as you like on young crops, but do not forget that as the sunshine and water help to give you a heavy crop, additional fertilisers ought to be used to make up for the large amount the extra produce takes from the soil.—H. DUNKIN.

IN THE TIME OF FLOWERS.

Now is the time when our thoughts find it difficult to choose from among our treasures the one flower which can be called the most beautiful. The Poet's Narcissus is yet with us; the tall and stately Tulips—a noble regiment, fit guardsmen for Flora's throne—are lovely. Chaste or bright Windflowers; blood-red Wallflowers with sweet-scented breath; snowy Candytufts; delicate Rockfools, with the hundred and one flowers of the late May time greet us brightly as we look out upon them now. Well is it that their beauties are great, for they have to hold their own in our eyes with the blossom of the Apple trees, so delightful in their beauty as these words are penned. It is, as the American poet says, a time of "Hourly burst of pretty buds and flowers," in whose presence we would fain remain for long even though the woods and fields would entice us with their many-voiced charms. The lover of Nature has so full a banquet of beauty before him that he cannot partake of all, and must, perforce, only enjoy a few of the many delicacies spread for his acceptance.

If we wander a little way we come on a place where "the wild Marsh Marigold shines like fire in swamps and hollows gray," as Tennyson says; but we need not go so far to see a more glowing picture given by its double sister-form by the Water Lily pool. As one looks upon the blaze of yellow these flowers of the double *Caltha palustris* give, we think of Jean Ingelow's words:—

O, brave Marsh Marybuds, rich and yellow,
Give me your money to hold!

By the margin of the pool, in the marshy soil, a big plant grows with its fresh luscious-looking green leaves thickly studded by the golden buttons which shine so brightly, and look so well when seen mirrored in the placid pool.

If the *Aubrietia*, with its broad spreading sheets of flowers, is beautiful, equally so are the spring Phloxes whose blossoms cover the stones over which they spread so freely. Not all of these have opened as these words are written, but enough have come to show us that our recollections of their beauties in former years have not been too highly coloured, and that those sheets of white, lilac, rosy purple, or centred flowers are as lovely as the pictures which swiftly come at our call from the cells of memory. One would fain bring more often before those who love their gardens the claims of these varieties of *Phlox setacea*, or, more correctly, *P. subulata*, which, on the rocky edgings of the borders or the rock garden slopes look so full of bright beauty.

As one views the Spanish and spreading Squills one's thoughts fly quickly to the azure sheen of the wild Bluebell of England, the Scottish "Craw tae," which, in many aered sheets, is not far away. Bolder and with larger flowers *Scilla campanulata*, the Spanish Squill, is not so graceful, perhaps, in its habit as our own *Scilla nutans*, yet as a garden plant or for wild gardening it may well be prized. Even prettier, I think, is *S. patula* in forms with white, blue, or pale flesh-pink flowers, which look so pretty in low spots in the alpine garden or by the wooded path. The first plants of *S. patula* in my garden were flesh-coloured, but their descendants have sported into white and blue, even prettier than the parent from which they came.

Some of the early Tulips are over, and now their brothers of later habit are in bloom or coming on. Very beautiful as are the English florists' Tulips for ordinary decorative garden effect, seen a little away they are not so valuable as the self-coloured forms. Some of the old Tulips, such as Golden Crown or Golden Eagle, are very beautiful, and superior in brightness to several which have been sold as "Darwin" Tulips. The latter have disappointed numerous growers, and the writer among the number. Many are dull and ineffective, and show no improvement upon the ordinary breeder Tulip. It may be that our British season is less bright than that of the Continent, and less able to bring out the colour of the flowers. However, the writer this season has the opportunity of testing a few varieties of "Darwin" Tulips direct from Messrs. Krelage & Son, of Haarlem. It is well to be frank, and to say that these were sent because of some unfavourable remarks made upon Tulips received, and seen grown elsewhere as "Darwins."

Of the collection one cannot yet speak as a whole, because all are not yet in flower. Of a few I fear I shall have to say that I do not care for them; but there are some of great beauty which well deserve to be grown in our gardens of border flowers. Very fine is *Pride of Haarlem*, with its deep, but bright red flowers. *La Candeur* is a lovely light variety. Exceedingly pretty is *Ed. André*, with its fine bright pink flowers. This Tulip has been much taken notice of by those who have seen it. Another beauty is *Reine Wilhelmina*, the colouring of which is difficult to describe; it may be called terra-cotta. The *Shah* is too dark for my taste; but *Kate Greenaway* is, though dwarf, very pleasing, and will be better still in a few days. One may say of such as have opened that they are vastly superior to the old breeder Tulips, which appear to be often substituted for the true stock, of which the flowers I have now are a specimen. The colours are brighter, and the flowers larger and better. One

must, however, leave for the present the Tulips, and glance at other flowers.

Very beautiful still is *Cytisus præcox*, with its soft creamy flowers, and it is accompanied now by *C. Ardoi*, a lovely little yellow Broom, only some 6 inches or so high. *C. scoparius* Andreanus is also in bloom, and is always a favourite with its crimson and gold flowers. Large plants of this Broom are very fine, and one recalls a specimen in an Irish nursery some 12 feet high, and clothed to the ground with branches. Much pleasure is yet afforded by the Anemones, and now that the varieties of the Wood Anemone are nearly over, one sees with satisfaction the advent of *A. narcissiflora*, of which I spoke in detail a year or two ago. One always enjoys its pretty white flowers.

Gay still is "Gold Dust"—*Alyssum saxatile*—and before it has passed away *A. gemonense* will be in full glory. Less compact, it is more prolonged in its flowering, and is thus of value when the Rock Madwort has gone for the year. The splendid blue of *Gentiana acaulis* is associated with such prettily formed flowers that everyone likes to look upon and into them. The *Gentianella* may have rivals, but it has no equals in others of the race. It is a pity that it does not do well everywhere.

Auriculas, Primroses, Polyanthus are a trio of favourite flowers at their best just as one writes. It is against the future of the stage Auricula that it needs so much care. It is so quaint and pretty that it will be a misfortune if it be true, as some hold, that it will go out of cultivation. In a quiet corner grows the lovely *Trillium grandiflorum*—the Trinity Flower of some—so called, because of the formation of its leaves and flowers. Scattered about in profusion are blue, white, and pink Forget-me-nots, the little yellow *Saxifraga cymbalaria*, and that pretty white weed, the *Claytonia*. There are Welsh Poppies—*Meconopsis cambrica*—in hundreds. They, like all the Poppies, thrive too well here. One would be safe in predicting that this *Meconopsis*, *Papaver pilosum*, *P. orientale*, and the annual Poppies would soon take possession of the garden to the ruin of many less prolific occupants.

As these last lines are penned, one feels that the tale of the garden in May is like that of many months before—one long enough in some respects, but not long enough to tell, as should be told, the beauties the month presents.—S. ARNOTT.

LONDON GARDENS OVER FIFTY YEARS.

No. 9.

SOME folks there are who seem to have a pleasure in forecasting evils that might possibly befall the biggest of all cities. At one time, we are told that London will at last be made desolate by a terrible conflagration; at another, it is suggested a huge tidal wave may submerge all the low-lying districts. The latest idea thrown out is that the greater part of the metropolis rests upon a subterranean lake, indicated by borings, which might be thrown upwards through internal convulsion, with results. Would it do to tap this extensively, and so supply London with water? Anyhow, in the olden time the British capital was the "city of the lake," on a hill between two meres, north and south, into which the Thames widened just there.

Finsbury and Moorgate are names yet standing that remind us of the broad space, of later history, upon which Sedges and Hair Moss grew freely, and our ancestors hunted wild fowl amongst the windmills. Even now, if a portion of this ground is left untouched, plants of the marshes are apt to spring up. When an old author, commenting upon the growth of London, remarked that it would some day be at "Hogsdon,"—i.e., Hoxton—people probably laughed, but the town went northwards with a rush far beyond that village, evidently named from the hogs that ranged its fields. For the Londoners did not then shut up their pigs in sties as a rule; indeed, these animals were occasionally made useful in gardens or cultivated fields to clear off decayed vegetables and various weeds.

Within Finsbury proper we have two conspicuous open spaces, upon which the eye of many a bypasser rests with a feeling of refreshment, even as he hurries by, and which are a boon to the neighbourhood. These are the gardens of Finsbury Square and Crescent, together about nine acres, enclosed a century ago. Farther off, really in "healthy Hornsey," as it has been called, is Finsbury Park, acquired for the public benefit in 1857, an expanse of 115 acres, with pleasant walks amongst flowers and shrubs, also having a part devoted to games, and retaining what was an attraction when the place was Hornsey Wood, a lake, upon whose banks oft sat the patient angler. The tavern on the edge of the wood was a popular resort early in this century, and, well enclosed by the trees, stood old Hornsey Wood House, once much visited too, the last possessors being two ancient dames, who delighted to sit outside under two venerable Oaks at the portal, listening to the hum of bees that made their combs amid the branches, and gossiping to their guests. We might have wished to see the old wood kept intact to this hour, but a park was needed for many thousands in crowded localities not far distant on the south, such as Hoxton and Kingsland.

Kingsland, though we may not realise it now, had a repute amongst the gardeners of Loudon's time. Bassington owned a nursery here, which had been commenced by Fairchild; and at Ball's Pond near was the establishment of Brooks & Co., who employed several travellers to collect exotics. This firm seems to have had a premonition of the importance of the Chrysanthemum, as they sought out varieties of it, while the plant was receiving little attention from gardeners generally. That Hoxton was once famous for its Roses and its fruit is certain. In its neighbourhood lived three notable gardeners of the old school—Ricketts, Pearson, and Darby; the last of these said to be the discoverer of striped Hollies. But fifty years ago Hoxton had ceased to be a village, or to have gardens worth naming; and all round it since houses have multiplied.

Lately the few small spaces which could be secured in the district, such as squares, from being eat walks or rubbish heaps, have been changed into gardens; also some churchyards are now made bright resorts for the living, who cannot possess garden plots of their own. In fact, it is amongst the old burial grounds that the London County Council and the Public Gardens Association have had chiefly to seek land for laying out, where streets have swallowed larger spaces, as in Hoxton, Dalston, Bethnal Green, and suburbs adjacent. St. Mary's Churchyard, Haggerston; St. Leonard's, Shoreditch; St. John's, Hoxton, are good examples of what may be done with a single acre. There was much rejoicing in Mile End when H.R.H. Princess Beatrice opened the garden of Holy Trinity; so, too, in Spitalfields, when Lord Meath performed the like ceremony at the Christchurch ground—a great boon to the most congested district of the metropolis. The churchyard of St. Dunstan's, Stepney, is large, having 7 acres; this was opened as a garden by the Duchess of Leeds in 1887. Still larger is Meath Garden, Bethnal Green, a transformation of what had been a repulsive cemetery. This was opened in 1893 by H.R.H. the Duke of York.

Half a century ago people spoke of Hackney as one of the rural suburbs of London. Some suppose hackney coaches took their name from it, because such vehicles were much used by its residents in their journeys to and from the City. Fields and market gardens extended to more than a thousand acres, besides some extent of marsh. A notable old street, Mare Street, seems to have been in proximity to a mere, or lake, which gave it the appellation. Nobles and citizens of standing had mansions formerly in what has ceased to be a fashionable part of London, and one of these claims a brief mention, because he was a horticulturist of the reign of Queen Bess, and many came to see his grounds at Hackney, where he grew flowers, vegetables, and fruits. This was Lord Zouch, friend of Ben Jonson. One of his experiments, we read, was the transplanting of trees that had attained some size. Pepys tells a droll story of a visit he paid to a friend at Hackney who had several greenhouses—greenhouses, that is, of seventeenth century style, with only side lights. Upon the roof of one of these his friend arranged to store rain water, but its weight was too much for the structure. On Pepys' visit he saw the catastrophe of this roof descending upon the plants and pots within. He would not know Hackney now. Even recently the increase of population is great; since 1851 it has advanced from 54,000 to 213,000.

Mare or Mere Street, already mentioned, is the most memorable of Hackney roads. There was a time when along the greater part stood on one side a fine row of Limes, and on the other a row of Elms. Half of these trees were cut down, in spite of protests, by decree of a local authority, some thirty years since. The absurd reasons were—first, that the falling leaves caused litter about the roads; second, that the trees were conducive to dampness; and third, that they interfered with the free circulation of the air! Few, or no public bodies, one hopes, now entertain objections to the presence of trees in a thoroughfare, but would rather encourage the planting of suitable species. Out of Mere Street runs Loddiges Road eastward, reminding us of a nursery which had a world-wide fame for many years, but which was tending to decay and closure when this Journal came into existence. There is no doubt that Loddiges' nursery owed its origin to John Busch, who commenced it on a plot of land near Well Street, subsequently it was removed to a part of the estate called Barbour's Berne. This man was one of the Dutch gardeners who had been successful in England, but when Catherine II. of Russia invited him to lay out her gardens, Busch left Hackney in 1771, transferring his place to Conrad Loddiges.

Who "Barbour" was nobody knows, but Darnley Road records the fact that Lady Lennox, mother of the ill-fated Darnley of Scotland, lived for awhile at the old mansion on the estate, which included many acres of field and orchard. Half a century ago a beautiful orchard existed on land which Darnley Road crosses. Loddiges' nursery comprised 15 acres, being divided into two parts. After he had inspected the houses, which were arranged according to temperature, a visitor crossed the public road by a bridge to the open ground. The firm had representatives in many countries, who sent home not only rare or new plants, but other objects, such as birds and insects. Its most successful period was the time of peace which

followed the Battle of Waterloo. First the large Palm house and crowded Orchid houses, kept at tropical heat, excited surprise. Then came a succession devoted to Heaths, Cacti, Ferns, and Camellias, of which Loddiges had a grand spring display. In the arboretum the species were arranged along a series of circular paths, on the right side trees or shrubs being placed alphabetically; on the left were Roses and herbaceous plants, the central space showed the American species. When this nursery was closed, many of its plants were removed to Chatsworth, or to the Crystal Palace grounds, just then laying out, Sir Joseph Paxton being an intimate friend of the family.

Certainly, though Hackney has grown largely as a suburb, it is not badly off in the matter of open spaces. Paradise Fields are built over indeed, like Loddiges' nursery, but there remains quite a cluster of commons around, besides a good number of acres of marsh land. There is Well Street Common, 20 acres; the London Fields, 26 acres, and Hackney Downs of 41 acres; close to it is also the expanse of Victoria Park. This is probably seldom visited by people living at a distance, but it contains a great variety of trees and shrubs, mostly in a flourishing condition, with a good sprinkling of flower beds well kept. At Homerton a beautiful bit of scenery was spoilt by the North London Railway, which cut through fields and gardens, especially in the extensive grounds of Wick House, which belonged to Lenev Smith, proprietor of silk mills on Hackney Brook. Towards Upper Clapton some fine views are still obtained, as when we ascend by Mount Pleasant Lane to the terrace on which stands Springfield. Here, looking towards the north-east is a charming view of meadows, water, and distant forest unrivalled near London. One of the older Nurseries, that of Low & Co., will shortly end its connection with Clapton, where it has long been famous for new and choice plants; the present headquarters are at Enfield, about which more hereafter.—J. R. S. C.

IVY-LEAF PELARGONIUMS.

I AM cutting trusses of the best double varieties now, and from the extreme beauty of the flowers, combined with adaptability as decorative plants—features which are as yet comparatively unknown—I am induced to send this note in their favour. The plants are easy of culture, provided their requirements are understood and supplied; the chief point in which beginners are likely to make a mistake being giving too little heat, at least early in the season. My experience with them is that they require to be kept warmer than the single varieties in order to insure plenty of flowers over a lengthened period.

The best time to propagate is the present for strong early flowering plants, and in August for plants to bloom later in the season. I like strong cuttings rather hardened at the base than soft. One cutting is put into a thumb pot filled with light soil, and the pots are placed in a warm pit until a fair number of roots have been made. During the summer months a cold frame suits them well. The attention they require is first to shift them out of the cutting pots when thoroughly well rooted, and putting into 4½ or 5-inch pots. The soil I use is turfy loam enriched with cow manure. The pots are well drained, and in potting the soil is made firm. Then they will require pinching at least twice—the stronger plants before potting, any others after they have become established. About the middle of September the plants are pinched the second time.

An occasional surface dressing of an artificial manure is of much benefit to the plants, and may be applied about once in three weeks from the end of August. The plants should be kept growing throughout the winter months, and if properly managed will require a slight dressing of manure at intervals, as above stated, right on until February, when they are ready to be transferred into 7 or 8-inch pots. A couple of months' further attention to pinching, staking, watering, and keeping the plants in a growing temperature will have secured fine strong plants full of flower. During the summer manure should be applied in weekly dressings, straggling shoots pinched and tied to sticks, and the trusses removed as they open fully, or as wanted.

August cuttings are harder than those which can be had now; moreover, they can be cut much longer, and the foundation of a strong plant is more easily secured. The cuttings root well, several in one 6-inch pot filled with light soil, or they may be put singly into 2½-inch pots and wintered therein. In any case it will be found that the cuttings will root more readily if they are placed under glass—such, for instance, as an early vinery. During the winter do not allow the plants to stagnate in a cold house, but keep them growing. In February pot the stock, using 4 or 5-inch pots, according to the strength of the several plants. If care has been taken to pinch those requiring it during the winter, the plants when potted will be stout and bushy, and will require much the same treatment as already advised for the earliest rooted cuttings. They may either be flowered as small plants in the early summer, or if potted into 7-inch pots will make strong fresh plants for flowering later. The same plants do very well a second year in the same pots, but though perhaps more floriferous the trusses are not so fine as on young plants.

As to sorts, all those we have had during the past year or two have been good. Single varieties are more easily managed, and are more floriferous, but I do not like them so much as the double varieties either for beauty or usefulness. In addition to their adaptability as pot plants, some of them are very suitable for growing in baskets or for drooping over the edge of stages. The stronger growing varieties run very rapidly up pillars when planted out, and are also of value for covering walls.—F.

LIVERPOOL NOTES.

A FEW years ago one would have been taken to task if one had hinted that the Cheshire side of the Mersey would become so thickly populated as at the present time, for the green fields were stretching far and wide, which now are covered with houses.

To keep pace with this the Wallasey District Council has been on the alert as regards recreation grounds, and a recent occasion saw the opening of Vale Park, Liscard, which it small must prove of inestimable benefit to all residents, the work having been done in a thorough manner, and the selection of trees planted a most judicious one. The park includes the Li-card Vale and Woodland estates, and some of the old plantations have been retained. Mr. J. G. Coombs, the Chairman of the Parks Committee, issued invitations to a large number of residents, who thoroughly enjoyed the proceedings, which took the form of a garden party. Mr. Coombs opened the park gates and admitted the public, subsequently addressing those present in support of the Council's action in providing these open spaces for the people.

The total cost of the purchase and work has been £12,230, the Surveyor, Mr. W. H. Travis, with the assistance of the Park Superintendent, Mr. Roeking, and the head gardener, Mr. Burston, being responsible for it.

ASPARAGUS SPRENGERI.

How useful are all the indoor varieties of Asparagus, and how large a part they play in almost every form of floral decoration, those who make it a study readily know. Such forms as *A. plumosus*, *p. nanus*, *deflexus*, and *tenuissimus* have for many years played a useful part, but I venture to assert that the somewhat new variety, *Sprengeri*, will rank for beauty and usefulness with any of the family. As a basket plant it is of the highest importance, the elegant glaucous shoots growing to a length of 7 or 8 feet, and given a moist temperature and a fairly rich compost, the growths are produced in abundance, and when cut for table decorations last much longer than the *Smilax*. Nor is this all, for numberless small growths with which the shoot is studded may be taken here and there and used for bouquets and wreaths with lovely effect.

Speaking of the plant to one of our leading florists, he assured me that it had come to stay. He believed it to be superior to all other varieties, and that already it had been simply invaluable to him, and was more largely used than any other.

THROUGH COUNTRY LANES.

The following bit of word painting, illustrative of the beauties of the suburbs of Liverpool, culled from the "Liverpool Courier," seemed so appropriate that I could not refrain from asking for space to include them in these notes.

"From the coach top you see, for the first time perhaps, how beautiful the world is that lies around Liverpool. Gateacre nestled in the valley, the long green arcades of Alterton—where the trees arch overhead like giant bows—Speke, Childwall, are all at their loveliest now, with that beauty which leaf-time brings. Though the season is so backward the colour in everything has softened and deepened. The Laburnum tassels are breaking into gold, the Lilac is out, and Apple and Pear trees are blossoming safe in deep orchards. Blackbirds are fluting, and the rooks, swarming on the field in farrow, rise in solemn flights at the rush and clatter of the coach and the horn echoing musically down the long green roads. The tiny hedge people get terribly nervous, and seem to think their homes are in danger. Such whirr and swirl of wings, and agitated circlings and dartings above beloved nests, such chatter and whimperings as the coach rolls past."

So says "Rambler," in his notes of May 20th, and I feel sure that other readers besides myself will enjoy, as I did, the perusal of the few intensely natural lines on a subject so near to us all.

AMATEUR GARDENERS' ASSOCIATION.

The effects of the peculiar season through which we have just been passing was apparent at the monthly meeting held in the Common Hall, Hackins Hey, Liverpool, under the chairmanship of Mr. W. Histed, when the exhibits, although of extremely good quality, were few in number. Miss Hunter was the most successful prize-winner, taking the first prize for a lady's spray, composed of pink Ivy-leaf Pelargonium and Fern, Mrs. McGregor being second with a composition of pink Roses, Lily of the Valley, and Asparagus plumosus. Miss Hunter took a prize for three sprays of Violas and second for Pansies. Mr. Cangle was first for Zonal Pelargoniums, and Mr. Turner for Carnations, the blooms of Germania and Uriah Pike being magnificent. The Judges divided the special monthly prize between Mr. Turner and Mr. Drake, the latter showing Cactus blooms set in sprays of *Adiantum gracillimum*, and also awarded certificates. An admirable paper on the cultivation of the Azalea and Gloxinia was read by Mr. Hoskyn, a member of the Association. Votes of thanks to the Chairman and Lecturer were unanimously passed.

THE FRUIT CROP.

There is always a certain amount of speculation in predicting thus early the promise of the year's fruit crop, but one thing is almost certain—viz., that early Pears will be very scarce, the piercing winds and biting frosts of last month playing havoc with the tender blossoms, and the absence of bees owing to the cold must make a big difference to the setting. Trees of shimmering white have all been divested of their load, which lies blackened and ready for the sweeper. Plums seem to be good, but I hope later to be able to send a summary of the crops in the district.—R. P. R.

ANEMONE SYLVESTRIS FLORE-PLENO.

THE many dozens of species and varieties of Anemones that are grown in gardens for various purposes are exceedingly valuable, and afford a rich diversity in colour, form, and time of flowering. The Temple Show brought forth an addition to the list, and one that will certainly meet with wide approbation. This is *A. sylvestris flore-pleno* (fig. 103), which was shown by Messrs. G. Jackman & Son, Woking. As in the well-known type, the habit of the plant is dwarf, and from the green leafage rise on tall footstalks the double pure white flowers. These are about the size of small Pompon Dahlias, and are composed of very numerous narrow petals, which have a green tinge towards the central crown of the flower. The Floral Committee recommended that *A. sylvestris fl.-pl.* should have an award of merit.

CHOISYA TERNATA.

THIS beautiful shrub may be described as an enlarged form of Rue in habit, densely branched and compact, though much freer and bolder in growth. It is an evergreen, leaves opposite, ternate, stalked, bright shining green, full of pellucid dots. Flowers white, sweet-scented, produced in axillary peduncles at the tops of the branches, simple or branched, with bracts at the divisions under the pedicels, which are channelled beneath. The shrub grows to a height of about 6 feet. is a native of Mexico, and was introduced into this country in the year 1825.

Though relatively an old plant, *Choisya ternata* is not often met with in gardens. For many years it was treated as a greenhouse plant, grown in a pot, and not often seen in flower, or very sparsely blossomed. Planted out in a cool conservatory border it charmed everybody by its delicious fragrance, the fine heads of white Jasmine-like flowers, set off by bright green foliage, being singularly lovely. Not many of such examples were, or are now, seen in cool greenhouses or conservatories, but no plant is more appropriate, especially when planted out in a bed of loam, or loam and peat, with a small quantity of leaf mould and sand added, over thorough drainage. It requires abundance of air, and all the light our climate affords, then it does splendidly in a cool or even unheated house, and the flowers surpass, because they can be had by everyone, those of the Orange, and even rival the *Stephanotis* in pureness of white and delicious fragrance.

But the *Choisya* has been requisitioned as a window plant for its beautiful green ternate foliage. It may sometimes be seen struggling for existence in "bays" with a north aspect, and may flower once in a while when given a western or southern exposure. Few are aware of its great intrinsic value for outdoor adornment, and coddle, or rather starve, it in a pot wherein and in present quarters, that of windows, it can never, or very seldom, do more than display half its beauties.

For walls of 6 to 8 feet in height *Choisya ternata* has peculiar fitness. It is, as before stated, evergreen, hence effective at all seasons, but when in flower quite delightful, having that rare essential of pleasing everybody. It grows in any well-drained soil, partially sheltered and relatively dry situation, being quite hardy in the southern counties of England, and even in the Midlands with the protection of a wall facing the south or south-west. In such position it flowers in the early summer months—May to July.

But everybody has neither a cool house nor a suitable wall, though they may have a potted plant struggling to make a show in a window, and it is on behalf of such that I write. Now is the time to plant it outside. It will be accommodated in a border adjoining the cottage, villa, or mansion, on the southern or western side. Turn it out of the pot, plant firmly and not too deeply, about 3 feet from the wall. Water occasionally, but only to prevent flagging, until the roots of the ball get a firm grip on the soil, and then wait the result. Do not be alarmed if the foliage get a little nipped by sharp frosts in winter, for this is only due to the plant's eagerness to show you what it can do—that is, it grows rather freer than is good for it at first, and the growth does not become ripe enough to endure sharp frosts. The spring after planting out there may not be any return, only a charming evergreen shrub, choice, and to some extent rare, but time will bring a rich reward. On May 27th there was a bush in full glory, about 4 feet in height, on the south-west of a villa in Manor Road, St. Albans. The soil is gravelly calcareous loam, over chalk with flints, but the substratum red with oxide of iron—a Cherry and stone fruit land, also just the thing for Hops. The situation is some 400 feet above sea level where the *Choisya* thrives, and charms the inhabitants of the oldest city in the British Empire.

Choisya ternata may be easily propagated by ripened cuttings, which root freely in sand, under a hand-glass, in gentle bottom heat, during spring and early summer. The cuttings should be inserted singly in small pots, and kept moist and duly shaded they will not flinch, but root, and the growth being a flowering one, form the choicest of little plants for decoration when hardened. There is the other plan of growing plants outdoors, getting them up to a flowering stage, then lift carefully, place in pots or tubs, and flower similar to other forced shrubs. Really we want more variety, especially of the sweetest and loveliest of spring and early summer flowering plants, and this is my excuse for writing these notes.—G. ABBEY.

SOME FORGOTTEN GARDENS.

IN this progressive age we seem to trample with an indifference (considering our mental status, it must be unconscious) the memories that link us to the silent past, and forget in our march the loyal work our pioneers have done in the fertile fields of horticulture. Our debt of gratitude to the Spanish Arabs must not be under-estimated, remembering that the western world had yet to learn how to enjoy the beauties Nature had lavished with seemingly reckless profusion, even before she could enter the lists with the dusky Moor, but time has proved her aptitude.

To the Moors we are deeply in debt for the finest fruits that grace our orchards and win encomiums for our gardeners, as well as the products

FIG. 103.—ANEMONE SYLVESTRIS FLORE-PLENO.

that have helped us to take an advanced position when traversing that avenue that leads to success—namely, rice, sugar, and cotton—whilst Spinach and Saffron hail from Spain.

Apart from the natural productivity of the soil, it was the custom in Granada to have orchards, vineyards, and flower gardens in every accessible spot. Some of the leading gardens were so arranged that a regular succession of crops could be insured all the year round, and such an impetus did they give, that to the present day the Orange and Lemon stand as dumb witnesses. The most famous garden—or, rather, the one that lingers in the page of history—was started by Abdurrahman the First at Cordova. Neither money nor brains was spared. These gardens were extensively stocked with the choicest trees that could be collected, celebrated for the rarity of the fruits as well as for fragrance, not to mention it was he who introduced the Peach to us. The imperfect description that we possess, and the ruins which the spoiler has not destroyed, testify that ornamental or landscape gardening had reached an advanced stage, as seen in the winding walks amongst flowering shrubs, the bowers of Roses, and crypt-like grottoes hewn out of stone, as well as cascades hidden by the shade of the mournful Cypress. Their gardeners boasted of the gradual blending of colour in the plots, while from their bedding plants they managed to have a distinctive fragrance.—A. O NEILL.

BLOSSOM BUD FORMATION.

TAKING the four questions propounded in the *Journal of Horticulture* for the week ending May 11th, seriatim, the first—"What is a blossom bud?" is superficially a simple question, although underneath lie Nature's secrets of reproduction. Secrets? Yes, and such as will, probably, never be divulged to the keenest scientific vision. Emerson defines this limit in saying, "All we know of the egg (the embryo) from each successive discovery is another vesicle (cell), and if after five hundred years you get a better observer, or a better glass, he finds within the last observed another. In vegetable and animal tissue it is just alike." A blossom bud, as I take it, is the embryo fruit, as the wood bud is the embryo of woody growth; or, in the animal kingdom, the egg, or other vesicle containing the germ of life is the embryo animal.

"How is it Formed?"—By a change in life of the tree, plant, or other vegetable, arising from, or contingent upon, what Dr. Lindley has termed the age of puberty. The doctor's theory, which is very practical for our purpose, is, that the time of this change depends, in a measure, upon adventitious circumstances, but more upon the idiosyncrasy or constitutional peculiarity of the individual. The latter is, of course, an inherent hereditary power, not liable to change, but capable of being affected in some degree by external influences.

"What Helps and what Hinders its Production?"—Upon this compound question is hinged the door opening to those external influences included in "adventitious circumstances." The age of puberty is, to more or less extent, the age of maturation; such maturation not necessarily implying the completion of growth (as in many annuals), of which there are innumerable examples in both kingdoms of life, showing that reproduction is not the sole end and aim of individual existence. "Adventitious circumstances" are many and varied, comprising both helps and hindrances to natural plans. Those pertinent to our present purpose may be briefly stated as local suitability; checks to gross growth by root-pruning, and judicious pinching and pruning, which matters have lately engaged the attention of writers and readers in the *Journal of Horticulture*. Such are undoubtedly aids to maturation, and consequent fruitfulness, and to health. The laws of health embrace the functions of life, and fruitfulness to the end of reproduction is a primary power in the well-being of the subject.

Question 4 introduces phases which appear to be departures from the normal. Given a healthy tree furnished with well developed fruit buds, it does not seem within the bounds of possibility to change them by any course of treatment into growth buds. That treatment could be employed to render the blossom buds abortive is another matter; in which case the sap would (as I believe is not seldom the case) be diverted to the formation of wood buds upon the spur in proximity to the abortive blossom bud. Probably, and my limited observation tends to this theory, the blossom buds produced from the spur are generally accompanied by obscure, latent wood buds ready for development should the function of the former fail. Superficial observation of this procedure may, of course, give rise to the supposition that a blossom bud (the embryo fruit) can undergo the metamorphosis of conversion into a growth bud.—K.

UNDER the closing paragraphs of "Pinching Fruit Trees," a subject that has recently claimed a prominent notice from several well known contributors of the *Journal*, the questions on the above subject call for deeper thought than did the pinching of fruit trees. This comes under the heading "Blossom Bud Formation," divided into four separated paragraphs.

What is a Blossom Bud?—This requires an education in scientific terms to satisfactorily explain. Briefly, it is the organ containing the various and delicate parts—pistil, stamens, petals, &c.—that go to form pollen grains, whereby the flower becomes fructified, either naturally or by insect aid, and is distinguished from the wood or leaf bud both in formation and purpose.

How is it Formed? is a question not less difficult to explain definitely, since the process of formation extends throughout the autumn and late summer months, slowly developing from one stage to another through the influence of sunshine and rain, and the ebb and flow of sap in the bark channels. There would seem to be much greater activity in the autumn in the growth of the blossom bud, which goes to show that the change in the constitution of the sap has a direct bearing on the formation of fruit buds. The leaf or wood bud is apparent in early summer nestling in the axil of the leafstalk in stone fruits, but not so the fruit bud; and in Apples or Pears it is not easy to decide definitely which are flower buds at such an early date.

It is curious to note what a contrasting difference there is between Peaches and Nectarines that are forced and those which are allowed to make their growth under more natural conditions—in cool houses or in the open. In the latter case the buds assume a plumpness by the

autumn that is seldom witnessed in a forced tree, and they are susceptible to weather changes that do not seem to affect trees that are forced. With a mild winter the buds in a cold house will show more activity in bud with the ventilators fully open, than will those in the early house after several weeks close confinement, accompanied by a little fire heat, and daily syringing of the branches.

What Helps, and what Hinders its Production?—The state of the weather is accountable for much, either in help or hindrance, and so are the means and provisions for attending to the cultural needs of the trees from the spring, when the leaves appear, until their fall in autumn. Extreme drought on the one hand and continuous wet on the other are both hindrances to a certain extent, as also is indifferent root cultivation. Trees whose roots are allowed to penetrate deeply into the cold subsoil make a rampant growth that can seldom be made fruitful, no matter what the conditions of culture may be otherwise. Wall trees that have their roots near the surface, and are neither watered nor mulched with some kind of protective material in times of severe drought, fail to develop healthy buds, as they do when the roots are deeply dug annually and the ground cropped with strong-growing vegetables.

Insect enemies of fruit trees in their varied forms account for some hindrances, especially if they are not promptly dealt with. In the case of Peaches on open walls, where there is no glass coping or other ample protection provided, blistering of the leaves will sometimes assume serious proportions. I have had to remove leaves twice and three times during the early season, almost entirely defoliating the branches for the time. This certainly hinders the production of blossom buds, and seriously weakens the trees. The judicious pinching of the summer shoots is a means for materially extending bud production. If pinching is practised too early in summer it forces lateral growth, which often is too soft and late to form flower buds.

If and in what way a Blossom Bud can be changed into a Growth Bud?—I have often noted in Apples and Pears, which prior to the time of pruning in winter had buds giving every indication and promise of being blossom buds, change the prospect most disappointingly later on when one looked for the expanding flowers. I have noticed, too, that those who persist in shortening strong shoots of either Apples or Pears often get sparse crops, from what I presume to be a conversion of fruit into wood buds? Vines which are unsatisfactory at the root and are not well ripened in their lateral wood will, if hard forced in spring produce tendrils instead of Grapes. Cases have been recorded where Vines which in the first break produced barren laterals have by skilful manipulation changed into fruitful ones the same season by severe pruning, and forcing a second break. Needless to say, this occurred only with early started Vines.

Briefly, "blossom-bud formation" depends largely on the methods of pruning adopted, general cultural attention to both root and branch, and the weather. Neglect the roots in strong soil, and blossoms become scant through over-luxuriance; in poor soil bud formation is hindered through starvation, while rational treatment in both cases results in abundance of healthy buds, which, with favourable weather, is followed by full crops of fruit.—W. S., Wilts.

A GREAT and important subject was opened by the questions in the *Journal* on May 11th, and if only a tithe of the readers express their opinions and relate their experiences fully the Editor would have sufficient "copy" to last for a year or two. Each of the questions would require a long discourse to do it full justice, and much would still be left unsaid. I rather startled a lad recently, who thought he could master the whole art and science of horticulture in six months, by telling him that I was "still learning," and he seemed to think it an appalling state of affairs that a man at my age should be "still learning." I fancy, with regard to the subject started, that this will be the condition of many of your readers, as it is most complex, and requires working out most carefully to arrive at any definite conclusions.

1. *What is a Blossom Bud?*—Theoretically it is a metamorphosed or altered growth bud, in which all the parts—sepals, petals, stamens (anthers), and carpels (pistils), represent a leaf structure converted to a special purpose, either protective or reproductive. We therefore find occasionally all these parts assuming the true leaf-form, colour, and nature. We also find the parts becoming converted into each other; thus stamens may develop into petals, and even carpels will also become petaloid in perfectly double flowers.

2. *How is it Formed?*—All blossom buds originate from the accumulation of substances in the branches or stems, elaborated by leaves mostly as starch rendered soluble and transferable as some form of sugar with probably other matter. In the case of deciduous trees this is partly deposited at the base of the leafstalk, hence it is commonly in the axil of the leaf that both flower and growth buds are formed. Without healthy, well developed leaves, we either get no buds, or they are weakly and imperfect. The bud is, therefore, formed by the leaf, just as in the case of Begonias, Bryophyllum, and some other plants, growth buds are formed, under suitable conditions, on their

margins or cut edges, and as the ovules or young seeds are regarded as buds forming on the margins of carpellary leaves variously infolded in the different systems of placentation (arrangement of the seeds in the ovary).

3, *What Helps, what Hinders its Production?*—The most obvious assistance to blossom bud formation is derived from a check to luxuriant growth, which is chiefly effected by decreasing root vigour. No practice, according to my observation, has greater tendency to promote the formation of blossom buds than careful lifting or judicious root-pruning; but this is influenced by so many conditions, the time when the operation is performed, the age and state of the tree, and subsequent weather, that only a general statement can be made, and perplexing or apparently contradictory cases occasionally arise. There is another condition opposed to the formation of healthy or perfect blossom buds, and that is the extreme of weakness due to some deficiency in the soil. In such cases I have known heavy dressings of natural manures, or phosphates and potash produce a marvellous increase in the number and vigour of blossom buds, but it must be remembered that the trees had already received a great check. The many hindrances to blossom bud formation are vigorous growth, severe branch-pruning, deep rooting, and the use of stimulating manures in naturally fertile soils.

4, *If and in what way a Blossom Bud can be changed into a Growth Bud?*—To this should have been added, Can a growth bud be converted into a blossom bud? Here observers and experimenters have an ample field for investigation, and they may expect to be "still learning" for a long time to come. It is my opinion that in its earliest state a bud is in an undetermined condition, and its development as a blossom or growth bud may be influenced by causes that operate respectively in checking or stimulating the vigour of the tree. As this stage occurs very early in many trees, usually long before the leaf falls, varying in different kinds and even in different individuals, and is influenced by the season, it becomes exceedingly difficult to gauge results. We cannot measure or determine the causes accurately, hence the effects are imperfectly understood. Very early autumn planting is more frequently followed by free flowering the following season than is winter planting, and in the same way young trees that have not been removed for several years in nurseries, more commonly flower abundantly or unduly the first season than those that have had an annual preparation. These ideas I have verified in a general way, but more comparative experience is required.—R. LEWIS CASTLE.

[*A natural question, the omission of which was not accidental. We observe our correspondent is too cautious to answer his own question, but sits on the fence in a mood of contemplation. Mr. Abbey seems to be resting too, and Mr. Picker silently watching.]

LONICERA HILDEBRANDI.

A PLANT of this remarkable giant Honeysuckle is now in flower in the Mexican house at Kew, where it attracts a great amount of attention. Apart from its being the first time that flowers have been produced at Kew, it is interesting from the fact that flowers of this species have only been known to have been produced once before in Europe, that event occurring last summer in the Glasnevin Botanical Garden. The species has been in cultivation at Kew for a number of years, large plants being found in several of the houses. These were raised from seeds which were obtained for Kew by its discoverer, General Sir Henry Collett, from Mr. Hildebrand in Burma. It is stated to be cultivated in Burma as a garden plant, and is found growing wild in the Shan States, but is not very common. In habit it is a very strong growing climber, making shoots in abundance, often a dozen feet or more in length, in a single season. The leaves are pale green, ovate, acuminate, with a membranous margin, and glabrous. They vary greatly in size, some being 7 inches long by 5 inches wide, others only half that size.

The flowers are produced in pairs from the axil of each leaf on the current year's growth. The largest of them are 7 inches long, the tube being about two-thirds of that. They are "chameleon-like" in colour, changing very rapidly. When they first open they are almost white, pink tinges being noticeable here and there. When about twelve hours old the colour begins to change, until at a day old they are pale yellow, the colour continuing to deepen, until at two days they are rich chrome yellow; about the third day the outside of the petals turn a reddish brown.

Altogether the plant is of great interest to both the gardener and botanist. From an horticultural point of view the plant, up to the present, has had one bad point, its shyness of flowering. Otherwise it is a handsome and free-growing climber which is little troubled by insect pests. As far as growth is concerned a wide range of temperature appears to suit it, growing equally well in a cool greenhouse and stove.

The example in the Mexican house at Kew is growing in fairly heavy loam, and the house has a minimum temperature of 50°. The species is said to flower with great freedom in Burma, and if it could be induced to do likewise here, its fragrance and beauty would insure it a foremost place among indoor climbers. A figure of it is in course of preparation for the "Botanical Magazine."—W. D.

RECENT WEATHER IN LONDON.—The heat in London since our last issue went to press has been intense for the time of the year. On each day the sun has been very brilliant, and the nights close and stuffy. There were a few clouds on Sunday and Monday, but they soon passed away. On Tuesday it was duller, but continued very warm, and the same conditions prevailed on Wednesday.

— ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, June 13th, in the Drill Hall, James Street, Westminster, 1 to 5 P.M. A lecture on "Rock Gardens, Ponds, and Rivulets in Gardens," will be given by Mr. F. W. Meyer at 3 o'clock.

— PRESENTATION TO THE REV. F. D. HORNER, V.M.H.—We learn that on Saturday, May 27th, the members of the Bradford Paxton Society paid a visit to the Tulip garden of the Rev. F. D. Horner, Greta House, Burton-in-Lonsdale. The kindness with which they always have been received, and the respect which is entertained for Mr. Horner, led the members to ask his acceptance of a Smoker's Cabinet. On arrival, the party were welcomed by Mr. and Mrs. Horner, the presentation being made by Mr. A. E. Banney, the President. An inspection of the garden was made, Mr. Horner explaining the evolutions of the florist Tulip.

— DEATH OF MR. J. CRAGG.—It is with regret that I have to record the death, at the age of forty-six, of Mr. John Cragg, late head gardener at Birchfield, Rusholme, Manchester, after an illness of ten days. Those who attended the Manchester Shows a few years ago will remember the splendid Orchids he used to exhibit, and he was also one of the first to show an artistic group of Orchids at the above shows. As a Chrysanthemum grower and judge his skill was high. The deceased enjoyed the confidence and regard of his employers, and his genial presence will be greatly missed by all who had the pleasure of associating with him. He leaves a widow, four sons, and two daughters to mourn his loss.—G. W.

— RHODODENDRON SUNDAYS.—Last and next Sunday are known in Kent as "Rhododendron Sundays," when, according to custom, the Earl of Darnley throws open his beautiful park near Cobham, the undulating walks of which are flanked by high banks of those splendid flowers. Family parties from all this part of Kent make the visit to Cobham Park an annual event, and as it is only some five miles distant from Rochester, or from Gravesend, it is easily accessible for Londoners. Those who journey on foot from Rochester, says Lloyd's News, will be interested in knowing that the lanes they traverse are those along which Mr. Pickwick and his friends set off to drive and ride to Dingley Dell on a certain celebrated occasion, while the "Leather Bottle" at Cobham is the house in which the broken-hearted Tupman meditated suicide over a cold roast round of beef and a tankard of the best ale. Who can ever forget, either, that it was in the street of the village of Cobham that Mr. Pickwick made his wonderful antiquarian discovery?

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. G. J. Ingram, the energetic Secretary of this Institution, has forwarded to us a copy of the rules and report of the Committee for 1898, and it is a book that is well worthy the perusal of every gardener and person interested in horticulture. Within its pages will be found a list of subscribers, and lengthy though this is, it might well be extended considering the splendid work that the Institution has done in the past, and in anticipation of what will be done in the future. It was for gardeners that the fund was commenced, and it is gardeners who should rally round it now. It is very easy to glean from the list that gardeners as a body are not properly doing their duty—we would not for one moment depreciate the splendid service that has been done by some—and they should awake to the knowledge of the benefits that are derivable from the resources of the Institution, and subscribe little or much according as their circumstances will allow. Let them remember that it is not the one who gives the greatest amount who necessarily derives the greatest benefit. We cannot of course recapitulate all the advantages of the Institution, and would recommend those interested, and who may not yet be subscribers, to write to Mr. Ingram at 175, Victoria Street, Westminster, and we think from the information that will come to them they will see and appreciate the Gardeners' Royal Benevolent Institution, and become yearly subscribers at once.

METEOROLOGICAL OBSERVATIONS AT CHISWICK.

The weather during the week has been warm and dry.

— **SUSSEX WEATHER.**—The total rainfall at Stonehurst, Ardingly, for the past month was 1.64 inch, being 0.31 inch below the average. The heaviest fall was 0.31 inch on the 15th. Rain fell on nine days. The maximum temperature was 75° on 31st; the minimum 34° on the 5th and 27th. Mean maximum, 53.51°; mean minimum, 43.02°. Mean temperature, 53.51°—the average. An extremely variable month. About the 20th it was cold, wet, and stormy. From the 22nd to 25th it was fine, and the mean temperature was 54°. The following three days gave a mean temperature of 46°, with a cold N.E. wind. The wind changed to S.W. on the 30th, and the 31st gave us the almost tropical mean temperature of 59°. In low lying places Potatoes and Beans have been blackened. On higher ground nothing has suffered, and the fruit crops—Pears, Apples, and small fruits—will be full.—R. I.

— **THE HOT WEATHER.**—The weather over England continues very warm, the highest temperature being still reported in and around London. On Monday morning the shade reading in the metropolis even at eight o'clock, was as high as 69°, and by 10 A.M. the thermometer had risen 10° higher. The maximum temperature, registered about midday, was again 83°, or precisely the same as on Sunday and Friday last, and about 17° above the average for the time of year. In London we have already had four days this month with a maximum reading of 80° or more, an unusual experience in the beginning of June. On Monday afternoon the appearance of the sky was again threatening, but the thundery aspect was not justified by any atmospheric changes in surrounding regions—the barometer being, as a matter of fact, unusually steady. Though dull on Tuesday morning it was oppressively hot, and the shade temperature again reached 83°. Not only in the metropolis, but over nearly the whole of England, there have been now twelve consecutive days without rain. With an abundance of hot sunshine the ground has naturally become very dry, and in many districts a few copious showers would prove beneficial to the crops.—("Daily News.")

— **FRUIT CULTURE.**—How slow we are to improve our methods in relation both to fruit culture and marketing, Mr. G. Bunyard's recent Society of Arts lecture, and the discussion which followed shows. For many years have we been insisting on the same ideas and suggestions, and with what poor effects. It all comes of our faulty educational methods, which are so much devoted to purely academic instruction in elementary schools, rather than giving instruction in the things of common life and common culture. Were our children taught the things in school which relate to their localities and local vocations, and less of worthless matter, what good ere this might have been done. We are indeed blind to allow this sort of thing to go on, and then find in after life what great mistakes have been made. In a fruit-growing county like Kent, for instance, the fullest instruction in the elements of fruit culture, and of the principles of marketing, especially as they have been expounded by Messrs. Assbec, Monro, and others, ought to form a leading part of our school curriculum. Then we should see lads when they left school taking readily to the vocation in which they have been taught. Now they leave school with totally diverse tastes and ideas, they learn to dislike rural life, they have hardly any association with it, and whilst the smartest go to the towns, the duffers remain at home, constituting a race that is stolid, and incapable in after life of improvement. In no department of trade, in no vocation, does it seem more difficult to create active progressive development than it does in the vocation of fruit growing for market.—A. D.

— **TREES.**—The trees serve us, Mr. John Gifford points out in a contemporary, by improving the soil, and by actually making both soil and land as well. They bring from deep layers great quantities of mineral matter, and in their leaves they deposit much of this on the surface, where is collected a mulch of humus of constantly increasing richness. The forests form soil by sending out acid-charged rootlets, which, with the acids of the decaying humus, have a potent effect in disintegrating the rocks.

— **TAR WATER FOR LEAF MINERS.**—Mr. Luckhurst is not happy with his tar water formula. First it was half a gallon of gas tar boiled half an hour in a gallon of water, then 50 gallons of water added = 1 in 100. This was reiterated, and now it is half pound of gas tar to 50 gallons of water = 1 in 1000. That is the correct thing, and was used in England half a century ago for curing mealy bug on Vines. It is wonderful how things travel from England to New Zealand and return again after a lifetime as new.—OBSERVER.

— **"GUERNSEY GROWERS' YEAR BOOK."**—The last issue of the "Guernsey Growers' Association's Year Book" is to hand, and contains a fund of information that fully maintains the Society's right to its motto of mutual help. Many subjects are ably dealt with by various contributors, and though the articles have been compiled mainly for the benefit of the market growers in the Channel Islands, there is much information that could not fail to be of service to growers nearer home. There are tables of freights and ready reckoners that are valuable as helping to save time, as well as other solid matter. The book comprises nearly 200 pages, and can be had for 1s., plus about 3d. for postage, from the Hon. Secretary, Mr. Andrew Marshall, St. Andrew's, Guernsey.

— **HOLLAND IN IRELAND.**—We are informed that early last week the usually tranquil village of Rush, Co. Dublin, was roused from its normal condition by all the bustle and excitement incidental to a Vice-Regal visit. Messrs. Hogg & Robertson, Dublin, were honoured by a command to receive her Excellency the Lady Lieutenant (Countess Cadogan), who, attended by Mr. Algernon Peel, Private Secretary, made an extended inspection of the firm's bulb farm. The Narcissi and early Tulips were of course over, but the May flowering species and Darwin Tulips, Anemones, and Ranunculus were at their best, and the wealth of bloom made a magnificent display. Her Excellency was pleased to express her satisfaction with the visit, and was specially struck with the large and varied collection of late Tulips, which were in splendid health. The firm received instructions to send a large collection of Daffodils and Tulips to Culford Hall Gardens, Bury St. Edmunds, in the autumn. Messrs. Hogg & Robertson's displays of Daffodils and Tulips in London and elsewhere have been much admired this season.

— **BARNSELY AND DISTRICT EXPERIMENTAL SCHOOL OF GARDENING.**—The first lecture under the auspices of the above school took place at the Queen's Hotel, Barnsley, on the evening of the 30th ult. Mr. Wm. Hoey presided, and pointed out the importance of adopting up-to-date methods, also the advantages the school would afford to gardeners generally. The object of the school is to test, increase, and improve the productiveness of garden land, and decrease the cost of production of crops by means of scientific research, and to teach, by means of plain practical object lessons, the art of budding, grafting, and hybridising, and generally to encourage the advancement of the higher branches of horticulture. The lecturer, Mr. Thos. Redington, F.R.H.S., Horticultural Instructor to the Yorkshire College, took for his subject, "The Present Day Need for Practical and Scientific Gardening." He began by showing the present condition of this country, commercially, as compared with some forty years ago, and pointed out that, whereas foreign produce of a horticultural kind was then practically unknown, we were now spending upwards of twenty millions sterling a year upon such imports. This state of things had been brought about mainly through indifference and prejudice—prejudice against improved methods of procedure in the cultivation of fruit and vegetables. He illustrated this by instances drawn from his own experiences, and concluded by urging that no improvement could be looked for until they made up their minds to pay more attention to the facts of advanced practical and scientific knowledge, and to apply the same to their everyday life. The lecture was well attended, and listened to with interest. On the motion of Mr. A. Chappell, seconded by Mr. Winter, a vote of thanks was given to the lecturer. This school is under the management of a Committee representing the California Gardeners' Society, the Barnsley Paxton Society, and the Longcar and Dodworth Road Shaw Trust Gardeners' Committees. Mr. W. Hoey is Chairman, and Mr. C. Hy. Parker, Shaw Lane, is acting as Secretary, *pro tem.*—("Barnsley Chronicle.")

— **RICHMOND HORTICULTURAL SOCIETY.**—The annual exhibition of this society will this year be held in the Old Deer Park on Wednesday, June 28th. The schedule which has been sent us by the Secretary embodies 100 classes, arranged for the benefit of all sections of growers, from the nurseryman to the cottager. For a 100 feet group a sum of £14 in four prizes is offered, while each unsuccessful exhibitor is offered a premium of £1. Six stove and greenhouse plants have £12 allotted to them, while for forty-eight Roses, distinct varieties in trebles, the three prizes amount to £13. In addition to these there are numerous classes in which generous prizes are offered, and it is to be hoped that a brilliant display will be brought together. The Hon. Secretary is Mr. C. R. King, 61 and 62, George Street, Richmond, Surrey. The show will be opened by Sir William and Lady Thyselton Dyer.

— **EREMURUS HIMALAICUS.**—The fine spikes of this beautiful herbaceous plant are now pushing up strongly, and unless severe frosts occur late in the month they will be longer than usual here. Just the tips of the leaves were all that was injured during the recent severe weather, as the crowns were only just pushing through the protective litter. It is a mistake to protect the Eremuri too early. The later they remain dormant the less likely are they to suffer from inclement spring weather. There is no need of covering as long as the sheathing scales cover the leaves when the large crown is pushing through, but as soon as the green tips of the leaves are seen a little loose litter should be placed about them, drawing it away with a fork on bright days and placing it about them again at night. When the litter is removed a mulch of soil and leaf mould should be laid on if it is to spare. When the large spikes are a couple of feet in height they must be staked, or they are apt to be blown over in rough weather. My plan is to push in two stakes 6 feet high at about 4 inches apart, the spikes coming between them and being supported by strands of raffia. This will be found a better plan than tying the spikes to a stake, as the stem is not bound and cannot be crippled.—H. R., *Coldham Hall*.

— **TEMPLE SHOW.**—We were compelled at the last moment, owing to lack of space, to withhold the following reference to the outdoor exhibits from our last issue:—The flower beds outside the tents were decorated for the occasion in a pleasing manner. Messrs. J. Cheal & Sons, Crawley, filled one with choice Conifers, another with Maples and Rhododendrons, and in between was an exhibit of topiary work, the first of its kind that has appeared at a Temple Show for some time. Messrs. Fisher, Son & Sibray, Sheffield, made a grand display with Asters, Ivies, and other foliage plants, with which they covered a large area. Messrs. Thos. Perkins & Sons, Northampton, sent plants of a new Ager, the foliage of which was very effective. Messrs. Jas. Veitch & Sons had a fine collection of Bamboos, conspicuous among which were *Phyllostachys nigra punctata* and *Arundinaria nitida*. Mr. J. Russell sent a few Guelder Roses, and also a good collection of Asters and other foliage plants. Messrs. J. Waterer & Sons, Ltd., Bagshot, set up a good display of hardy Conifers, including many choice varieties, which were very effective.

— **NOTES FROM HAMPTON COURT.**—Visitors to these famous gardens have now the pleasure of seeing the fine collection of florists' Ranunculus, which are flowering profusely. Besides numerous small clumps here and there, there are two large beds, each 15 feet by 12 feet, and holding several hundreds of plants in remarkable variety and of great beauty. These are strangers at Hampton Court, and will be regarded with undoubted admiration. It would be impossible to describe the colours and markings; they are varied and beautiful. Later on two similar large beds will be seen in fine bloom of Spanish Iris, and without doubt these will be most beautiful. Too much praise can hardly be given for the introduction of handsome flowers of this description; as years roll on it is hoped that many others may be introduced. In a bed, planted doubtless temporarily with shrubs out of pots, numerous plants of *Spiraea confusa* are charming. Apart from the beauty of this shrub when gently forced in pots, it is not less so when grown outdoors as an ordinary hardy shrub. In another bed there is a fine show of bold mixed Pansies, from out of which rise white flowered Marguerites. I saw in one of the London parks some days ago a bed of similar Pansies dressed with Solomon's Seal that produced a very charming effect. A far too free use of standard silver variegated Asters has been made in the pleasant inner or private gardens, and, as will be seen in a few years, they will present a tawdry, cockney-died appearance. There are fully thirty or more of them planted where half a dozen would have been ample. Golden Privets as standards, and red leaved *Prunus* are enduring. In some places two Asters and one *Prunus*, or *vice versa*, are planted in triangles 4 feet apart. Such planting, and in such a charming old garden, is enough to drive a lover of Nature to distraction.—A VISITOR.

— **THE WINCHESTER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—At a meeting held on Monday, May 29th, Mr. Harry Curtis, gardener to W. F. G. Spranger, Esq., J.P., Southampton, gave a most interesting lecture on "Some Hardy Garden Flowers." Mr. Curtis said it was impossible to deal in one evening with hardy flowers as a whole, so he had elected to treat of a few of the most useful, especially those best adapted for flowering in spring, and which would be found suitable for large or small gardens. He dealt with the *Myosotis*, *Aubrietias*, Pansies, Wallflowers, Hollyhocks, Delphiniums, Antirrhinums, and the *Helleborus* in detail, describing in each case the different varieties in cultivation, and pointing out those of improved form and colour. He advised in every case but the last named to grow the plants from seed, procuring the best possible strains, as being the best and cheapest method of securing a large number, especially for spring bedding. Cultural directions followed for the kinds named, and thus the lecture was of practical value to many young gardeners, the present being the time to prepare for next spring's display. There was a brief discussion, and a number of questions were satisfactorily replied to, after which a vote of thanks was accorded to Mr. Curtis, who exhibited a fine assortment of hardy flowers.

— **MARRIAGE OF SIR PETER WALKER, Bt., OF OSMASTON MANOR.**—On the occasion of Sir Peter Walker's marriage to Miss Ethel Okeover, which was solemnised on May 30th, the decoration of the church was entrusted to the able hands of Mr. Bardney, F.R.H.S., head gardener at Osmaston Manor. Near the entrance, and on either side of the crimson-carpeted walk, two magnificent Palms were placed. These were blown over a few minutes prior to the ceremony, but it was not long before they once more reared their stately heads, carrying one's thoughts to the luxuriant foliage of tropical climes. Under the noonday sun this could be forgiven. Turning again to the sacred edifice, lovely Pansies in beds of moss lined the porch, and the interior was a study in delicate colouring, the various flowers and Ferns having been arranged with the perception of a true artist. Lilies and Palms embellished the font, and the windows were beautified with Lilies of the Valley and *Spiraea*, Arum Lilies being also employed in the treatment of the altar window. The screen was decorated with clusters of Lilies and Lilies of the Valley, backed by sprays of Asparagus Fern, and around the altar stately Palms towered above tasteful groupings of Rhododendrons and Lilies. Variegated creepers were entwined around the altar rails, Lilies of the Valley reposing at the foot in mossy beds, the whole effect being of a charming description. The decorations at the Hall were also of a noteworthy character. The drawing-room and the entrance were nicely decked with Lilies of the Valley and Arum Lilies, and wherever flowers were arranged they were used to the best advantage, the decorations being greatly admired. Lilies of the Valley, white Roses and Asparagus Fern, graced the tables at the wedding breakfast.—("Ashbourne News.")

— **THE ASHFORD VINERIES, COBHAM, SURREY.**—I looked in on Mr. Smith, the manager of this extensive range of glass houses, to see how the 11,000 Strawberry plants layered last summer direct into the fruiting pots had turned out. Not a few growers object for various reasons to this method, preferring to layer into small pots first. Great numbers of the plants had fruited and were turned outside. Many others were in full fruit. In six huge spans, 150 feet long, there were seven or eight rows standing on the floor down the centre fruiting finely, even in such a difficult position. But the fruits were as fine and as well coloured there as on the shelves. Some were in more favourable positions, but about 150 lbs. had been gathered and marketed in five days, evidence of the sort of crop that was being produced. In these houses Gros Colman Vines were covering the roofs two-thirds up the rafters, thus showing how far from the light the plants were. In some 160 feet long houses that have been during the past winter planted with Peaches and Nectarines, Tomatoes being just got out between these trees, there were planted out as lifted from the open ground, all down the centre of each house, several rows of plants just blooming or setting fruit. These would give the latest inside fruits, as the houses are quite unheated. Under any circumstances outdoor Strawberries cannot be very early, and much of the early expanded bloom has been cut with frost. Several thousands of young plants, chiefly Royal Sovereign, have been put out to produce early runners for layering. I could but notice that whilst nearly all the vineries run north and south, one large span running east and west seemed to give the best results, especially on the south side. No doubt a far greater amount of sunlight and warmth is thus obtained than is the case in spans of the other aspects. Arums here are grown in immense quantities, and thrive wonderfully well. Next autumn the Grapes will be worth going miles to see.—WANDERER.

CYPRIPEDIUM MACROCHILUM GIGANTEUM.

At the Drill Hall on the 16th ult. Messrs. J. Veitch & Sons, Ltd., staged a singularly beautiful, and at the same time remarkable variety of *C. macrochilum giganteum* carrying three flowers, one of which was abnormal, as shown in the illustration (fig. 104). The flower in question had two upper sepals, these descending on each side of the pouch, the result of the division of the customary dorsal. This break did not result in disfigurement or detract in the slightest degree, but distinctly enhanced the beauty of the flower. There was, too, in addition to the two long tail-like petals, a central petal depending gracefully in front of the pouch, and of equal length with the others. These, owing to their great length, have had to be curled upwards by our artist to show them entire. The well developed pouch was normal and of handsome form. The parents of this plant were *C. grande* and *C. caudatum* Lindenii. It is a matter for regret that all the flowers on the plant were not of this type, which is well worthy of perpetuation if such be possible.

CATTLEYA MOSSIÆ BEAUTY OF BUSH HILL.

The average quality of the Orchids at the recent Temple Show was comparatively high, but those of extraordinary merit were not particularly numerous. Of those that attracted most attention one of the chief was *Cattleya Mossiæ* Beauty of Bush Hill, which was exhibited by Messrs. H. Low & Co., and is represented by the woodcut (fig. 105). It is a strikingly handsome flower, and the reticulation over almost the whole surface makes it very distinct. The prevailing colour in the sepals and petals is delicate rose purple, with reticulations of white. The splendid lip is crimson in the centre lobe, with yellow side lobes, and a crimson veined throat. It was in every way worthy of the first-class certificate that was recommended by the Orchid Committee of the Royal Horticultural Society.

ONCIDIUM CARTHAGINENSE.

THOUGH the individual flowers of this species are small, they are produced on branching racemes that make a pretty show for many weeks. The plant has no pseudo-bulbs, the spikes springing from the base of the large spotted leaves, and growing a couple of yards or more in length. The flowers are white spotted with rose, but very variable, as may be expected by the species occurring over so large a tract of country in a wild state.

ODONTOGLOSSUM INSLEAYI SPLENDENS.

This is without doubt one of the most beautiful and showy of *Odontoglossums*, but the true form is much rarer than is usually supposed, some dealers labelling good forms of the type as *splendens*. The latter, when true, is quite distinct in having no trace of the reddish-brown spotting on the sepals and petals, but a very broad marginal band of crimson spots to the lip. It is not by any means constant as regards flowering, some plants throwing up their spikes in autumn, others in winter and spring. It thrives well in the cool house, treated as for *O. grande*, with rather large pots and a well-drained rough compost.—H. R. R.

LÆLIO-CATTLEYA HIGHBURYENSIS.

THIS is a beautiful hybrid raised in the collection of the Right Hon. J. Chamberlain, from whose seat it takes its name. It is a cross between *Lælia cinnabarina* and *Cattleya Lawrenceana*, and there appears to be a great difference in the various seedlings raised, which perhaps is only to be expected from two plants with such diverse characters as these. The best varieties are very pleasing, as the clear yellow ground, heavily suffused with bright rosy purple, of the sepals and petals, and the bright crimson-purple lip, are most striking. It will succeed under the same treatment as either parent. On account of its beautiful colour it is worth attention, and when mixed with *Cattleyas* of the *labata* section, such as *C. Mossiæ* or *C. Mendeli*, is very telling.

LEPTOTES BICOLOR.

A plant of easy culture, which is most useful where buttonhole bouquets are in demand, is *Leptotes bicolor*, as its white flowers, with a rosy streak in the lip, are very charming. It thrives well in small pans suspended close to the glass in an ordinary intermediate house; in fact, I have seen nice plants grown in a warm greenhouse. The plant is of small habit with terete leaves or bulbs, and when in active growth should be well supplied with water; but when at rest greater care must be taken, and no more than is really necessary should be applied, as excess favours decay. The usual Orchid compost answers its requirements.

CYPRIPEDIUM CALLOSUM SANDERÆ.

This most beautiful albino is perhaps more sought after by *Cypripedium* lovers than any existing variety, and it is no doubt a great acquisition to those who are fortunate enough to possess a plant. It is easily distinguished from the typical *C. callosum* by its much lighter markings or reticulations on the foliage. The plant is a good grower in a warm *Cypripedium* house potted in equal portions of peat

FIG. 104.—CYPRIPEDIUM MACROCHILUM GIGANTEUM.

and moss. Thrips should be carefully guarded against, as they mark and permanently injure its delicate foliage, which is not only a great eyesore but also very weakening to the plant. It is at the present time unfolding its lovely green and white flowers, and is indeed a gem, comparable only with the charming *Cypripedium Lawrenceanum* Hyeanaum, which I find is not quite so vigorous. Great care must be taken in applying water, especially in the dull winter months; they will both succeed under the same conditions.—J. BARKER, *Hessle*.

HYDRANGEAS.

DURING May and June few pot plants produce a more imposing effect than Hydrangeas. Hortensis seems to be the favourite variety, and it is grown in immense quantities by market men. All who see them admire the beautiful little specimens, each carrying a huge flower head, which find their way to the markets, where they command a ready sale. Few plants are more easily cultivated when the right method is pursued; yet in private gardens generally they do not appear to be grown in anything like the numbers they should, considering their great usefulness. At Barford Hill, near Warwick, Mr. R. Jones grows large numbers of them splendidly, as he finds them of great service for decorative purposes.

As a hardy border plant also Hydrangeas are exceedingly effective, and I know of one Kentish garden where they form a great feature during the summer months. Those who happen to have a few old plants growing in pots or in the open border should endeavour to raise a stock of young ones, as I consider it is in a young state that they are the most useful.

Early in August is a good time to begin the work of propagation. I select strong tops, and leave two joints to each. These are inserted in a mixture of good loam and leaf soil, pressed very firmly into 3-inch pots. The cuttings ought to be inserted deeply, so that the leafstalks of the large leaves are covered with soil; this is the first step towards securing dwarf sturdy plants. Every cutting may be relied upon to root if placed in a cold frame and kept close, shaded, and well syringed, admitting a little air as soon as signs of growth are apparent. When roots are plentiful admit air freely, and eventually remove the lights to get the growth firm and ripe, as it is important to prevent growth being made during the autumn; the aim should rather be to secure a plump bud, and keep it dormant till the spring. This object may be accomplished by leaving the plants fully exposed till the first week in October, then removing them to a cool house, which only receives sufficient fire heat to keep out frost, and throughout the winter keeping the plants dry at the roots, giving just enough water to keep the leaves from falling.

During February commence to give more water, and when the plants are growing freely place in their flowering pots—5 or 6-inch, using a compost of three parts good loam, and one of fresh stable manure passed through a half-inch sieve. Pot very firmly, and sink the plants quite up to the first pair of leaves, in order to secure a dwarf sturdy habit. Subsequent details of culture are simple enough. It is in the management up to this stage that some growers fail. If a number of plants are wanted in flower early, grow them in gentle heat in a light house from the time of the final potting till the flower bracts appear, then remove to an ordinary greenhouse temperature, as the flowers come pale in colour, instead of a delicate pink, if kept in heat while they are expanding. Whenever the weather is bright and warm syringe thoroughly daily, to promote healthy growth and keep green aphids at bay. From the time the flower bracts are just visible until they are fully expanded regular feeding should be given in the form of liquid manure, and an occasional top-dressing with some good chemical fertiliser. This is an important point to observe, in order to produce large individual "pips" and "bracts."

If Hydrangeas are grown in soil highly impregnated with iron the flowers will assume a peculiar bluish tint, and some years ago I accomplished the same result by mixing iron filings from a blacksmith's shop with the potting soil. The beautiful pink colour is, I think, to be preferred to the blue, but nevertheless it is interesting to be able to produce both shades of colour from the same variety of Hydrangeas. Dr. Hogg, with its distinctly variegated leaves, is worth growing in limited numbers, but as the flowers are not so imposing as those of hortensis they do not sell so readily in the markets. *Paniculata grandiflora* is a superb variety, of which, both for growing in pots and for shrubberies, cut-back plants make beautiful specimens.

In private gardens, where large conservatories have to be kept gay during the summer months, *paniculata grandiflora* should be grown into large specimens by shifting the plants annually till they occupy 12 or 14-inch pots, then by feeding freely grand specimens, carrying from eighteen to two dozen flowers may be grown in a few years. Two-year-old plants of hortensis are also very attractive. An excellent method to pursue to have them in good condition is the following. As soon as the young plants have finished flowering, cut them down to within half an inch of the soil; two or three growths will

FIG. 105.—CATTLEYA MOSSIAE BEAUTY OF BUSH HILL.

then come; when these are growing freely turn them out of the pots, reduce the ball, and replace into pots of the same size, grow in the open air till autumn, keep cool during the winter, and place in 7 or 8-inch pots during February or March. Three gigantic heads may then be produced on a single plant. *H. hortensis* is a profitable plant if grown well, as each one requires little space; they sell readily, and do not require much fire heat.—H. DUNKIN.

FORSYTHIAS.—These are very pretty shrubs, quickly and easily grown, and flowering early in the season. The greenish yellow flowers look very pretty when the bushes are planted near some of the better varieties of *Ribes sanguineum*. The Forsythias open first, but are still fresh when the *Ribes* flowers. Although thriving in a way on almost any class of soil, the Forsythias are worth a good soil and situation, and where the former has been deeply stirred and the plants are well established, long Willow-like shoots are made that are wreathed with flowers in spring.—H.

DRIBLETS FROM DUBLIN.

A CORRESPONDENT expresses the hope that space may be afforded for the following paragraphs; it is readily found, and Dublin pars may dribble again.

THE ROYAL HORTICULTURAL SOCIETY OF IRELAND ROSE SHOW.

The summer show of the above Society will be held in Merrion Square on Thursday, the 29th of June, and promises to be a great success. Their Excellencies the Lord Lieutenant and Countess Cadogan have accepted the invitation of the Council to visit the Show. The prizes offered for competition are fairly numerous; the following is a list of the principal ones:—Messrs. Dickson & Son, Newtownards, for a stand of thirty-six Roses, a silver plate, value £25. Offered for a stand of Begonias by Messrs. Hartland, Cork, a challenge cup, value 6 sovereigns. For a stand of herbaceous plants, cut blooms, twenty-four, a silver challenge cup, value £25. Presented by Major Donville, J.P., Loughlinstown, a challenge plate, value 10 sovereigns, for a stand of twenty-four bunches of Carnations or Picotees; also a silver cup, value £5, presented by Mr. Watson, Clontarf, for a stand of twelve bunches of Carnations. Edmund Johnson, Ltd., Dublin, present a silver challenge cup for a stand of seventy-two Roses, cut blooms, thirty-six varieties, open to nurserymen only. Messrs. Kelway, Langport, offer a silver-gilt medal for a collection of cut flowers. There are forty-five classes in all to be competed for, and in addition there are three money prizes, given by the Society, in each class. Intending exhibitors must remember that all entry forms must be lodged with the Secretary (W. H. Hillyard, Esq.) by the morning of the 23rd inst.

DUBLIN NATURALIST FIELD CLUB.

The second excursion of the members of the above club took place on the 27th of May to Ireland's Eye, under the direction of the Honorary Treasurer, H. R. G. Cuthbert, Esq., and was well represented. Twenty-eight members and their friends attended; they left Amiens Street Station by the 1.55 P.M. train for Howth. The party embarked in boats at the West Pier, Howth, and in less than half an hour reached the object of their attention. One boat was retained by the party during the afternoon for dredging, but the major portion of the company had a botanical trend and spent an enjoyable afternoon in examining the features of the island; the principal specimens which were in greatest abundance was the Bluebell and Vernal Squill. At six o'clock tea was served, and the party returned to town by the evening train.

DUBLIN WEATHER.

The hearts of gardeners and farmers are elated by the spell of splendid weather we are favoured with, and the heavy rainfall of the previous fortnight has well moistened the ground; the pastures, nearly bare a fortnight ago, are now covered with a wealth of verdure, and recall to our mind the act of some magic wand. The conditions for successful Turnip sowing are probably now the best with a glorious sunshine overhead and an active germination, which should help the young shoots to baffle an attack of the destructive Turnip fly. Orchard growers are storing a large quantity of empties to meet the expected luxuriant crops. Our public gardens are looking well in their foliage and blossoms, and if favourable weather continue there will be ample scope for the reflective to indulge in speculations of the beautiful, and admirers to lovingly linger over the pleasant but fleeting joys of life.

PEACHES AND NECTARINES AS STANDARDS.

IN a neighbouring garden is a small house filled with Peach and Nectarine trees planted in a central border and trained as short standards with free heads. This has a remarkably pretty effect when the trees are in flower, and, what is more important, the amount of fruit produced is very large.

I am personally of opinion that more fruit can be grown in this way than from trees trained in the usual way under the glass, while a much more equal distribution of light is insured than when the trees are grown on the cross-trellis principle. Obtain small trees and plant early in the season just as the leaves are turning in firm borders prepared in the usual way. To get well-balanced heads a good deal of care is required in disbudding during the first few years, also attention to stopping strong shoots and judicious management of sub-laterals.

The first year the trees must be allowed to make all the growth they will, always provided that it is firm and well ripened, and that due regard is had to the balancing of the trees, so to speak, not allowing the upper shoots to grow away at the expense of those near the stem. A light or heavy crop the next season, according as the trees are weak or vigorous, should insure their well-being and prevent any need of root-pruning, which is in many cases a makeshift practice easily preventable.

—H. R.

OUR GARDENS.*

UNDER the above comprehensive title, the Dean of Rochester has written, as might be expected, a book that is sure to be widely read by lovers of gardening. That is well, but it would be better if the still larger community who are only more or less interested in gardens would read and digest what is so agreeably and often humorously contained in its pages. There is a refreshing frankness about the book that almost goes to show that the author would divide our population into three great classes:—1, Those who really and truly love gardens and flowers and derive inspiration from them, making their own lives and the lives of others the happier; 2, those who think they are devoted to gardens, but know little about them, and are really more devoted to themselves; 3, those whose minds are sealed against the appreciation of influences beautiful, pure and good that emanate from gardens when the spirit is attuned to the pitch of receptivity. The Dean does not tell us that he would actually so separate the great mass of humanity, but he does most clearly indicate his strong hope that all would love gardens with the same intensity that he does, and learn wholesome lessons from the great book of Nature that has afforded him solace in his journey through life.

No one knows better than the learned and talented author of the admirably produced volume before us that the first essential of a book to render it acceptable to the constituency to which it appeals is that of readableness. An author may write with the utmost precision, revise with scrupulous accuracy, and teach the soundest of doctrine, but if the style is of the stiff, formal, dry-as-dust character the pages will only be read with pleasure by a comparative few, and these probably the least in need of the matter imparted. Dean Hole has the aptitude to a larger degree than have most men for making people read. It is a great gift or acquirement, and when, as in this case, words of wisdom, born of long experience, are set forth in pleasing association; when wholesome thoughts and good suggestions are woven into sentences which otherwise would be of a plain matter of fact character; and when a point is illustrated by light or amusing anecdote, the reader is carried along to the end, and is ready to tell his friends of the pleasure enjoyed, while he has imbibed something of the author's earnestness and knowledge by the way. The work under notice contains sixteen chapters, and certainly the best form of representation will be by taking a few extracts from some of them.

ENJOYMENTS OF A GARDEN.

This is the opening chapter, and the following are the opening words:—

"I asked a schoolboy, in the sweet summertime, 'what he thought a garden was for?' and he said 'Strawberries.' His younger sister suggested 'croquet,' and the elder 'garden parties.' The brother from Oxford made a prompt declaration in favour of 'lawn tennis and cigarettes,' but he was rebuked by a solemn senior, who wore spectacles, and more back hair than is usual with males, and was told that 'a garden was designed for botanical research and for the classification of plants.' He was about to demonstrate the differences between the Acoty- and the Monocoty-ledonous divisions, when the collegian remembered an engagement elsewhere. A capacious gentleman informed me that nothing in horticulture touched him so sensibly as Green Peas and new Potatoes, and he spoke with so much cheerful candour that I could not be angry; but my indignation was roused by a morose millionaire when he declared that of all his expenses he grudged most the outlay on his confounded garden." This we can quite believe, and more congenial is another experience. "Not long ago I paid a visit to my friend, Frank Goodhart (*nom de plume*, but an accurate description of the man), who has a small but charming garden some twenty miles out of London, wherein, before he leaves home for his daily work in a Government office, and when he returns from town, he spends his leisure time. Here I found him late on a summer's eve, and a healthier, happier, hotter, or dirtier person, I do not remember to have met in the society to which he belongs. As for his apparel, I was constrained to state that I could not have believed that a man of his ancient lineage and liberal education would have robbed a scarecrow were I not positively convinced in my own mind that I had seen his jacket on duty. He only replied with a peremptory direction that I was to 'catch hold' of two huge watering-cans, fill them from a tank some 50 yards away, and bring them back *toute suite*. For an hour I wobbled up and down his walks between these ponderous utensils, until the dressing-bell rang, and my friend, having made himself a C.B., resumed his ordinary aspect as an English gentleman."

IGNORANCE.

Under this heading we find sentences that the truth of which is, unfortunately, beyond question:—"An immense majority of those who possess large gardens are the passive slaves of their gardeners, incapable of giving directions, afraid to suggest them, lest they should expose their ignorance. The peer, the baronet, the squire, is his own Master of the Horse, and can give orders to his stud-groom with all the confidence of knowledge and with all the dignity of power; he knows the pedigree of his thoroughbreds, the specialities of every steed which he rides or drives. In his presence the head gamekeeper, elsewhere a man of arrogant

* J. M. Dent & Co., Aldine House, Bedford Street, London.

demeanour, enriched by the 'tips' and flattered by the familiarity of the gunners, makes the meek obeisance of true respect to his employer, who can marshal a troop of beaters, or break a retriever, or bring down a rocketeer, as well as he can; but he stands before his gardener speechless—cannot remember whether he was instructed by his wife to insist on more flowers for the room or more room for the flowers, and dare not fulfil his promise to the farm-bailiff to reduce the extravagant amount of manure which is demanded for the garden."

PIONEERS AND PROGRESS.

In these chapters we have interesting historical matter dealing with the initiation of gardens and the advancement of gardening. The Romans, we are told, were the first gardeners in Britain, but growers of vegetables only, not flowers. "They were glad, as some of our magnates now, to defray part of the labourer's wages from the results of his toil. Their success was in proportion to their zeal, and was esteemed to be of such honourable merit and distinction, that Cicero, Fabius, Lentulus, and Piso derived their appellations from their skilful treatment of the Vetch, the Bean, the Lentil, and the Pea." We are then reminded of the arrival of Augustine "not with the shout of battle, the fury of the oppressor, and the clash of arms, but with psalms and hymns and spiritual songs, with prayers of penitence, with promises of pardon, with the offer of eternal peace. There was neither sword nor spear—a simple cross and a message from the Crucified, 'Come unto Me, all ye that travail and are heavy laden, and I will give you rest.'" Ecclesiastics were for long the chief farmers and gardeners, in connection with monasteries; eventually they grew flowers, but "almost exclusively for church decoration, for their altars and shrines, for marriages, for the graves of the departed. Sometimes the priests wore floral garlands, and it is on record that at the consecration of a bishop at St. Paul's Cathedral in 1405, the canons walked in procession crowned with Roses. It is still the custom, when the judges pay their annual visit to St. Paul's, for the canons to carry bouquets in their hands, but a similar embellishment of the head would bring all London to see. Nevertheless this ancient coronation might be suggestive and helpful to some gay young ritualist, yearning to irritate the Protestant mind, and a garland of Sunflowers or a wreath of Dahlias could hardly fail to succeed." In the ancient gardens topiary work, or clipping evergreens into fantastic shapes, receives a strong rebuke in "the mistakes of the Creator were to be rectified by the gardener's shears." Bridgeman, we are informed, was the inventor of the sunk fence, and his successor, Kent, is honoured as Field Marshal of English landscape gardening, of which the chief modern exponent was Robert Marnock.

THE FORMATION OF A GARDEN.

Excellent hints are imparted in this chapter. It is said on formation work "Nature must really be put 'in form.' You may rectify, arrange, develop, or, alas! you may disfigure and destroy; but if you would win the approbation of her smile, you will never think to thwart her, and only to alter or assist, as she may teach you; ever listening for her instructions, and obeying the intimations which she gives. I have watched with great interest attempts to improve Nature. I remember an under gardener who carved flowers with his pocket knife out of Turnips, chiefly the Ranunculus, the Camellia, and the Tulip, and coloured them with stripes and spots of the most gorgeous hues; and I recall a day when, passing by the potting-shed in which he was exhibiting his splendid achievements to a friend, I heard him say, 'They whacks natur—don't they, Dobbs?' And Dobbs replied, 'They whacks her ea-sy.'"

COMPONENT PARTS OF A GARDEN.

In references to climbing plants, of which the Dean gives a good selection, he describes Ampelopsis Veitchii as "the greatest of the many treasures which Mr. Veitch has introduced into this country, because its enjoyment is not restricted to the rich, but is within the means of all who desire it." On the subject of lawns we cite, "There should be in front of every home a piece of green grass, as spacious as the means permit, well mown, well rolled, kept free from worm and weed. 'The lawn,' writes Mr. Robinson, 'is the heart of the garden, and the happiest thing that is in it.' Flowers may come, and leaves may go, the lawn goes on for ever. It refreshes the spirit through the eye, which never tires. We wander all over the world in search of things pleasant to the eye; we find them here and there; but nothing delights us more than the green fields and the green lawns, which are only to be seen at home." The subject closes with an amusing anecdote. "A gardener, not far from Rochester, having obtained through the kind influence of his master a more lucrative appointment at a lunatic asylum, came back after a year's absence to visit his benefactor, and standing with him on the lawn, he said, 'I suppose, sir, you remember Peggy?' 'Of course,' it was answered; 'the two-year-old Exmoor pony we bought at Maidstone fair and put into the mowing-machine when she was almost unbroken. What battles you had, and what a good bit of stuff she was when she came to years of discretion.' 'Ah!' replied the gardener, 'I used to think that no man ever had, or could have, such a rampaging job, but now that I've got to mow with seven lunatics, most of 'em wanting to sit down, I often wish that I was back with Peggy.'"

THE ROSE GARDEN—A DEFENCE AND A "SELL."

After giving good advice on the herbaceous border, our author discourses on his favourite theme—Roses, and proceeds—"And who are you, I hear the critic say, 'Who made you Lord Chamberlain to the Queen of Flowers?' I make answer—because he who would guide others must show his credentials—'If you please, Mr. Critic, I am the man who invented Rose shows, and won many cups, and wrote a book about Roses,

and am the President of the National Rose Society, and for fifty-four years I have admired and studied the Rose.' If the critic intimates, not for the first time, that I have wasted this portion of my life and dishonoured my sacred vocation by these diversions, I lose all sense of humility, boldly proclaiming that I have not only derived from horticulture great help and refreshment in my work; but, brought up among horses, hounds, and partridges, I have from boyhood to middle age occasionally enjoyed the sports of the field; and that as regards my ministrations in a small country parish, I always maintained the daily service of the Church and my daily visits to the school; knew every man, woman, and child in the place, and have preached, since I took orders, in 500 churches from the Land's End to the Border. This is rank egotism, but it is provoked by rank ignorance." Now for the "sell." The Dean, on being asked to propose "The Visitors" at a great city dinner, observed an elderly gentleman with his hair cut close with the exception of an enormous white moustache. "He wore over his breast a broad crimson ribbon, and I said to myself, 'That's a Maréchal of France!'" Accordingly I proceeded to welcome our friends from France with a polite bow to the Maréchal, and finally expressed my special sympathies as a rosarian indebted to France for the introduction of our most beautiful Roses. "It is no exaggeration to say," I concluded, turning with a sweet smile to the Maréchal, "that 'La Rose est la Reine des fleurs et la France est la Reine des Roses.'" I sat down and inquired the name and title of the illustrious soldier, and was told that he was a London pawnbroker, wearing his badge of office as president of a benevolent society."

GENERAL SHABLEKINE.

This is not the heading of a chapter, but the name of a Rose recommended by the Dean with the following footnote. "This Rose is not in our English catalogues, and must be procured from the raiser, Mons. Nabonnand, Grasse, Cannes, Nice, France. Lord Brougham describes it as 'caring neither for cold, damp, sun, or mildew;' and he declares 'that if a law was passed that one man should cultivate but one variety of Rose, he should without hesitation choose General Shablekine, as being without a rival, flowering continuously, with 100 blooms of equal merit on a plant. Its constitution and hardiness would guarantee its success in our colder climate, and of all Roses it is the most faithful and generous.' Without disparaging the merits of the General, one could have wished that the flower had received a more euphonious title. The Rose by any other name would have smelt as sweetly."

OTHER GARDENS.

Excellent and instructive are the chapters on the rock garden, the water garden, the wild garden, and the cottage garden. The author has a great desire to help the sons of toil and make their homes brighter and better, and hence his appreciation of the efforts of County Councils, and indeed all who give encouragement and instruction with that laudable object in view. Nor are children's gardens overlooked, while an admirable chapter on town gardens is contributed by Mr. Marsland.

A WORD TO YOUNG GARDENERS.

In the "Pedagogue's Farewell to His Pupils" we find these words, which cannot be too widely disseminated. "I must earnestly implore the young gardener not to be wise in his own conceits. Of all the prides since Lucifer's attaint, there is not one more disastrous to progress and success than that which will never acknowledge ignorance, and would rather remain in darkness than ask a neighbour for a light. I confess in sackcloth and ashes that I was misled for the greater portion of my life by this moral obliquity, and I am sure that, if I had resisted and overcome it in my youth, I should have quadrupled my store of useful knowledge. Nor can I derive much solace from the fact that this stupid arrogance is a common disease: so is the influenza. It wastes time, loses opportunity, and gets in other people's way, like a loafer at the corner of the street."

Let it not be supposed that we have extracted the "best bits" from this entertaining and suggestive work. We have done nothing of the kind. We have simply taken a few lines from about half the chapters, in their order, and which fairly represent the style and character of the book. The volume comprises 300 pages of matter, much of it even better than the samples. It ranges from gay to grave. There are parts that will make the reader smile and others that will make him pause and "think." It will impress on many that the great ecclesiastic and gardener has a big and tender heart, full of sympathy for the toiling millions who strive to improve their lot in life by diligent labour in the garden; and the rich whom he esteems the most are those who cherish their own gardens, and in addition give help and encouragement to the present and future working populations of the land he loves.

CERCIS SILIQUASTRUM. — In several gardens about Kew fine examples of the "Judas Tree," as this plant is popularly called, are to be found, all flowering with exceptional freedom, while in the Royal Gardens several exceptionally fine specimens are a mass of colour. The habit of the plant is rather straggling, if pruning is not attended to while young, which often causes it to be planted in out of the way corners; if, however, it is kept in shape from the time it leaves the nursery, dense round bushes can be had, 12 feet or more in height, deserving a place in a prominent position. On different plants various shades of colour can be had, some forms being almost white, others rosy red, with several intermediate shades. It is not particular regarding soil, a medium loam, perhaps, being most suitable for it.—W. D.

TROPÆOLUM SPECIOSUM.

MANY have been the complaints made with regard to flowering this beautiful creeper in the south of England. People who have returned from a tour in Scotland, and who are at all imbued with horticultural taste, come home wondering at the luxuriant manner in which it flowered in all kinds of situations, covering walls and outhouses, climbing into Apple trees, and in fact behaving very much like our common Bindweed, in places becoming quite as much a weed as that plant. When it was suggested that we might do the same with it in our southern climate, we were told that was impossible, the Scotch mists were favourable to its growth, and that in our drier climate we could not expect it to grow so luxuriantly; but as it is a native of Chili, one could not quite think that this statement has any strong foundation, nor has it in truth. I have seen it growing vigorously on the walls of Berkeley Castle in Gloucestershire, and Messrs. Paul & Son have it in great luxuriance in their nursery at High Beach, in Epping Forest. I have myself failed with it most egregiously.

I have several times obtained liberal supplies from Scotland, have planted it in different positions in my garden; it rambled about as is its wont, but never flowered with any degree of profusion. It got amongst the bush fruits, and was, I suppose, destroyed when they were being dug over. I tried another plan with it last year, and having obtained a small tub out of which I knocked the bottom I placed it in a border facing north. It did not flower, but has come up strongly this year, and I am hopeful I may be more successful. I have given several tubers away to friends, and they seem to have been equally unsuccessful, and have not been able to keep it beyond the year.

I think it must be a most capricious plant, for I came across a very remarkable instance of its success in a neighbour's garden. Two years ago he planted some tubers against a fence facing S.W.; the plants flowered fairly well the first year, but the second year he hardly saw anything of them until his gardener said, "I wish you would get up here, sir, and see this Tropæolum." It had worked its way under the fence, and there, he said, "I saw a space about 15 square feet one mass of brilliant scarlet," evidently showing that what I was always told in Scotland, that it preferred a northern aspect, was true. The stronger shoots have remained untouched by the winter, and he is now endeavouring to get some of the shoots back again to their original position, but he will also plant some in a more congenial place.

It is strange that a plant like this, coming from Chili, should prefer a northern aspect, though, of course, one does not know in what places it grows in that country, as there may be various positions there that it affects rather than others. Now as ours is a dry country, the average rainfall being low, and as it succeeds so well in Scotland, which is the very reverse of this, it would seem to be one of those plants which can accommodate itself to various positions. I do not think that it is at all exacting in the matter of soil, though I imagine it prefers a light and open one. Perhaps this brief account may give encouragement to some who have tried this very lovely plant, and have failed, for whether we regard the delicacy of its foliage or the brilliancy of its flowers it is well worthy of cultivation.—D. Deal.

CARNATIONS AT ICKWORTH.

GARDENING in all its branches is well carried out at this beautiful place, the seat of the Marquis of Bristol, under the superintendence of Mr. H. Coster, but the palm for excellence must certainly be awarded to the tree Carnations. The cultivation of this most beautiful section is understood by Mr. Coster as by few other gardeners, and it is a pity he does not give us a taste of his quality at some of the London exhibitions. The first thing that strikes a Carnation specialist on entering the flowering house is the fine healthy appearance of the whole of the plants: not only the easily grown kinds, but sorts that in most places are found difficult to grow.

As an instance, there is the beautiful Mrs. Robert Sydenham. This is in many places an absolute failure, and only in a few can it be said to be really a success, but at Ickworth the plants grow almost as strong as Uriah Pike, and produce abundant "grass" for propagation. And such splendid flowers, the contrast between the creamy yellow ground and the rosy flaking being exquisite, while the form and substance even of side blossoms is remarkable. This variety alone is worth a long journey to see, but the Ickworth collection is replete with such, all the up-to-date varieties now in commerce, and many grand things not yet introduced to the public being included.

I often find amateurs and gardeners spending a lot of their own and their employer's money upon new and improved high-priced varieties of plants, but they are so poorly cultivated that they show no advance upon previously known kinds. Now at Ickworth not only are the very latest novelties added to the collection, but each and all are so well cultivated as to bring out their true characteristics, and show the real advance upon known kinds.

I am not going to give a list of varieties noted, or long descriptions, for such are not interesting reading, but I would like to mention two lovely varieties that I have frequently seen exhibited, but never in such form as here. They are Jessica, a soft satiny rose, and Exile, a rather deep r tint of the same colour. I am quite within the mark when I say that I never saw such perfect blooms, and it is not to say there are only one or two, the house is filled with such. Lady Bristol, a lovely seedling of Mr. Martin Smith's not yet in commerce, is a beauty, and there are many more almost equally worth mention.—H. R. RICHARDS.

THE TEMPLE SHOW.

AMONGST exhibits at this great show, the production of which has been so worthy of the R.H.S., I regarded as an exhibit of high-class culture, superior in relation to the plants to any yet seen, that grand group of double and single Begonias from Messrs. T. S. Ware & Co. It was universally admitted to be the finest show of these plants ever seen. Other great exhibits, exclusive of Orchids, were Turner's and Paul's Roses; Veitch's Caladiums, Phyllocaetuses, and hardy plants and flowers; Smith's grand Clematises, Fisher, Son, & Sibray's fine group of foliage trees and shrubs, Cutbush's wonderful group of Carnations and other plants, Sutton's singularly interesting collection of Nemesises, the Guildford Company's and Messrs. Backhouse's miniature rock gardens, Messrs. McIndoe's and Fyfe's collections of fruit, and Messrs. Bunyard's Apples. Messrs. T. Rivers & Son's collection of trees in fruit was good, but not equal to what the firm has shown in some previous years.

But how little effort in producing artistic or picturesque effect was seen! How the London public would have been sensationalised over one of the Shrewsbury groups, the most marvellous plant arrangements of modern times. Messrs. Fisher & Son's Maples, and Messrs. Cutbush's Carnations, Messrs. Veitch & Sons' hardy flowers and plants, Mr. G. Paul's Roses, and the miniature rockworks mentioned, really quite charming, were the best efforts in the direction of securing artistic effect. When it is said that artistic arrangements are impossible at the Temple the question is begged, but they may be difficult. Mr. White in arranging the President's splendid Orchids, did so thinly, and they produced a far more pleasing effect than did any other Orchid exhibitor.

FLORALLY DECORATING FRUIT.

Opinions differed at the Temple Show as to whether Mr. Fyfe's really superb collection of fruit was or was not improved in appearance by the addition of some flowers in small glasses. Still, that the flowers did add charm in the estimation of many persons there could be no doubt. But I did not think Ixias and Sparaxis set into low broad glasses with some fine Thrift-like foliage quite the best flowers for the purpose; nor were the receptacles. I like small vertical glasses best, and the flowers very light with fine Fern, such as the fronds of *A. gracilimum* and a few Grasses. The glasses need not be all of one pattern, and certainly not all of one height. The flowers should not be too numerous. Given these conditions, flowers undoubtedly add to the beauty of fruit collections.

VEGETABLE COLLECTIONS.

At the Temple Show there were for the time of year and season many fine exhibits of vegetables, prominent amongst which were Peas, Tomatoes, Cucumbers, and Asparagus, all of superb order. But the finest of these were found where collections were not too varied. In the cases of collections intended to be very representative, the effort to have such did in some instances result in bringing some things not attractive, and better left at home. There was not one of these comprehensive groups but would have been more attractive and more worthy of honour had there been much less of inferior produce in them to detract from the merits of what was good. It is far more meritorious to show a few kinds of vegetables prominently and well, than to include many of very inferior merit. I should like to see exhibitors another year taking this hint, and acting as advised.

SOCIAL ASPECTS OF THE TEMPLE SHOW.

It is very evident that in spite of the kindness of the R.H.S. Council in offering to sell gardeners in advance tickets for the Temple Show on the second day at the reduced price of 1s., that the privilege is not largely availed of, and that for one gardener there on Thursday there were twenty on the Wednesday. No doubt gardeners prefer the first day, because horticulturists of all classes are then seen. Even the R.H.S. Committees constitute a big gathering of various gardeners, amateur and professional, and of course their duties call them to the Temple on the first day. Very few of these are seen the next day. Again, exhibitors and their assistants constitute a great body of gardeners, and they are always strongly in evidence on the first day.

No wonder, then, that Wednesday is the favourite day with gardener visitors, and they can be met with by hundreds then. That the Temple Show is therefore the greatest social gathering of gardeners for the year found in the kingdom there can be no doubt. But whilst it may be thought desirable to utilise to some practical purpose this big gathering, everyone familiar with the labour involved in the show work, and in the time absorbed by purely friendly greetings, men well known to each other meeting but perhaps once a year in this way, knows that any organised gathering of the clans is out of the question. Without doubt so far as attendances can be secured the Chiswick and Crystal Palace gatherings offer the best opportunities for organised gardeners' meetings.

VENTILATING FLOWER SHOW TENTS.

The altogether unlooked-for heat which greeted the Temple Show seemed to illustrate in a manner all too effective the apparent incapacity of tent makers to produce any real approach to proper ventilation; on all the three days the tents became stiflingly hot, the temperature being, for the good of the exhibits and comfort of the crowds of visitors, about 20° too high. Certainly, there were times when the temperature must have ranged from 80° to 90°. No wonder if those who had once run the gauntlet of the three long tents (from which, once in, there is no escape till the other end is reached) refused to return *via* the same way. No wonder, also, that cut flowers collapsed suddenly and distressingly. Such things as Roses, Poppies, Pæonies, Violas, and many others, were ruined in a few hours. No one seemed to have made any arrangements for a supply of fresh flowers the next morning.

The only remedy for this sort of thing, and it is very common at summer flower shows, is to be found in liberal top ventilation. But that is never supplied. Tent makers turn out their canvases in huge pieces without opening of any kind, and the pent up air becomes superheated. We want large openings in the roof, which can be opened or closed in a moment, as needed, by long cords. Any such arrangement would be intensely welcome. Probably if flower show committees would insist upon good ventilation being an absolute condition of payment for use, tent makers would soon meet the difficulty satisfactorily.—A. D.

[We have had letters of complaint too strongly worded for publication, on the overheated and unhealthy atmosphere of the tents of the above show. The greater the faultiness of tent construction, the greater the necessity for doing the utmost that can be done to reduce the inconvenience, or we might almost say the sufferings, of the dense crowds wedged together in a long range of overheated marquees, from which quick escape is impossible. The Temple Show is only one among many during hot weather at which visitors have serious cause to complain. It is true that in some instances the upright canvas is unlooped from the roofs here and there, as was done at the Temple; but in nine cases out of ten this relief is resorted to hours too late to be effective. If ventilation is afforded in the simple manner indicated an hour before the atmosphere becomes overheated on a sunny morning the benefit resulting to products and visitors remains all the day; but if the unlooping is done an hour or more too late, when the atmosphere is already stifling, only a comparatively small amount of good is or can be effected. Every gardener knows that if a vinery is allowed to get 20° too high before the sashes are opened the excessive heat cannot be subdued without injury to the Vines; but with timely ventilation the oppressive heat can be either prevented or reduced to a minimum. It is the same with a marquee, only in this case the matter of early ventilation is of even more importance, because provision is so rarely made for the escape of hot, vitiated air through openings in the roofs, though there are exceptions. The subject of tent ventilation requires the serious attention of all managers of flower shows.]

SHORTIA GALACIFOLIA.

J. BENNETT's question relative this pretty plant can be best answered by quoting from Mr. Robinson's "English Flower Garden," a work that ought to find a place in every horticultural library. We there find it described as "an interesting and beautiful plant. It was first discovered over a hundred years ago by Michaux in the mountains of North Carolina, and re-discovered in 1877. It was found growing with *Galax aphylla*, and forms runners like this plant, being propagated by this means. The plant is of tufted habit, the flowers reminding one of those of a *Soldanella*, but large, with cut edges to the segments, like a frill, so to say, and pure white, passing to rose as they get older. There is much beauty, too, in the leaves, which are of rather oval shape, deep green, tinged with brownish crimson, changing in winter to quite a crimson, when it forms a bright bit of colour in the rock garden or border. It succeeds well in various soils and is hardy. It is also a delightful plant in a pot, as the flowers on their crimson stems are pretty, and one gets also the prettily tinted leaves." The woodcut (fig. 106) will be of interest to our enquiring correspondent.

PACKING PEACHES AND NECTARINES.

MANY and various are the methods of packing Peaches and Nectarines adopted, but if all presumably answer the purpose of those who follow them it cannot be truthfully asserted that there is no room for improvement, in some of them at any rate. As a matter of fact, much valuable fruit is practically spoilt owing to either careless or faulty packing. No fruit is more easily bruised and disfigured than ripe Peaches; and what is also a very important point, no fruit is more quickly tainted in flavour owing to being surrounded or enclosed in either scented boxes or strong-smelling packing material. So susceptible are they of being affected in flavour by contact with scented or musty material that Peaches, and in a lesser degree Nectarines, after being gathered ought never to rest on anything but fresh tissue paper with a padding of some kind underneath. Fruiterers sometimes display them on fresh Vine leaves, but those who know their business take good care to remove the leaves before night arrives. Naturally some varieties are superior in point of quality to others, Royal George, Bellegarde, Crimson Galande, and Grosse Mignonne being among the best, but the majority of other sorts are quite good enough for most people, and if not first-rate in flavour there is all the more reason why every care should be taken to guard against tainting them.

Peaches and Nectarines to travel well ought not to be quite ripe when packed; nor in any case should they be left on the trees till the falling stage is reached. They keep better, travel with least damage, and are really more luscious and richly flavoured when the full ripe state is anticipated by at least one day. Lightly pressing the under side of a fruit that appears to be ripe enough to test will not injure it, but there must be no finger or thumb marks. For the markets an appearance of ripeness, and in particular plenty of colour, are most needed; slightly under-ripe fruit best meeting the case. Fruit that is inclined to cling to the trees must not be roughly dragged away, or thumb marks will detract considerably from their value; but the gatherer should have a pad of

cotton wool in his left hand with which to firmly grasp the fruit, and then, where possible, to cut through the footstalk with a pair of Grape scissors. Nectarine Lord Napier is one of the most difficult to gather without bruising, and the pad and scissors ought certainly to be used for detaching the variety from the trees. If all the trees are examined every morning, and each fruit fit is gathered, there will be no necessity for suspending nets under them. The latter will only break the fall, and do not wholly prevent bruising.

Opinions vary both as to the form of box and packing material for Peaches and Nectarines. The fruits vary greatly in size and form, some being extra large both as regards depth and circumference, others being flat and of a good breadth, and still more comparatively small in every way. The boxes, therefore, ought also to vary considerably, it being little short of madness to pack deep fruit in shallow boxes with an insufficiency of packing both above and below to prevent bruising, while very deep boxes are unsuitable for small or flat fruit, owing to the unavoidable springiness and eventual shrinkage of the packing material. What market salesmen favour are boxes 24 inches long, 14 inches wide,

FIG. 106.—SHORTIA GALACIFOLIA.

and 4½ inches deep, these holding twenty-four fairly large Peaches and rather more Nectarines. These, however, are scarcely deep enough for Sea Eagle, Walburton Admirable, and large fruits of Barrington Peaches, and are larger than are required for fruit from very heavily laden trees. It is advisable to have boxes made for private use in sets, the depths being varied. If there are no opportunities of getting them made very cheaply in the neighbourhood they can be obtained for surprisingly low figures from advertising makers. I find cheap light boxes from grocers and confectioners answer well for sending by post, being also frequently used when there is no likelihood of the receivers returning the empties. Market salesmen and leading fruiterers now-a-days are always ready to send boxes and baskets suitable for any kind of fruit that is to be consigned to them, and all things considered it is much better to have their boxes than to provide for oneself. Boxes with separate compartments for each fruit are a great mistake.

We have next to consider which is the best kind of packing material out of the several available. Experienced packers largely favour moss for Peaches and Nectarines, and it is extensively used for the purpose, especially by senders to markets. When abundance of clean springy moss can be raked up from lawns, or otherwise collected, and dried, well beaten, and thoroughly cleared of rubbish, it answers well, and is the cheapest material that can be had. Unfortunately moss is by no means generally plentiful, at least not such as may be said to be fit for packing soft, easily tainted fruit in. Coarse, earthy-smelling moss will not do, and small quantities of that which is suitable are of little value. Moss

must be used freely and not gingerly. First line the boxes with sheets of packing paper, and then place a firm layer of moss, not less than 1 inch thick, in the bottom. Wrap each fruit in a square of tissue paper, bringing the points of the latter well up together over the nipple of the fruit, and then place in the box and completely surround by moss, enough of the latter being used to well divide the fruit. The base of each fruit ought always to rest on the bed of moss in the bottom of the box, and only the tips of the paper protrude above the same material when finishing off. The lid should press down rather tightly on the paper and moss, the packing being so firmly done as to prevent any movement inside the boxes when these are tested by shaking rather violently. If the packing will not bear this test at the outset, what state will the fruit be in after a certain and inevitable amount of shrinkage accompanied with some rough handling has taken place?

Paper shavings are sometimes recommended as a substitute for moss, but according to my experience they do not answer well, it being a very difficult matter to prevent the fruit shifting in them, and bruising accordingly. Bran is even worse, while the coarser kind of wood wool or shavings is too harsh, too springy, and too strongly scented to be suitable for packing Peaches and Nectarines in. More recently a superior kind of wood wool has been introduced, this being much softer, and if well opened out and cleared of dust a few hours prior to using there is no smell perceptible. This I am now using for Peaches and Nectarines instead of cotton wool as formerly, and have had no complaint either of the fruit travelling badly or of being tainted in flavour. I have hitherto found Peaches and Nectarines travel better in cotton wool than any other material, always provided each fruit is carefully enclosed in soft paper, and then bound round with folded strips of the wool of sufficient width and in such a manner that the latter shall prevent the fruits touching each other or the box. Cotton wool ought always to be folded skin side outwards, and even then should never come in contact with fruit. When returned it must be dried prior to being used afresh, as it is apt to become moist, also heating slightly, and smelling strongly.

I now use the improved wood wool. The boxes are thickly and firmly padded with it, and after the fruit have been enclosed in squares of tissue paper each has a bandage of wood wool wound round it, all being gradually packed closely and neatly together. The box lids closing down tightly on the points of paper and upper part of bandage, there is no shifting of the fruit afterwards. This plan of bandaging the fruit will be found to answer better than burying them in nests formed in a well-filled box of wood wool, as in the latter case the elasticity of material is apt to gradually reverse the position of the fruit. The fewer nails used in fastening down the better, but the boxes may well be stringed together, and very plainly labelled "Fruit, with care."—MARKET GROWER.

ISLE OF WIGHT.

THE monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday last. Dr. J. Groves, B.A., J.P., presided over a good attendance of members. An excellent paper by Mr. J. Hygate, The Briary, Cowes, on the "Cultivation of Dahlias" evoked an interesting and profitable discussion, which was taken part in by the Chairman and Messrs. W. Cook, T. Collister, S. Banks, G. Verdon, J. B. Spencer, and S. Heaton. Mr. T. Collister, gardener, Steyne, Bembridge, staged a collection of Aquilegias (Veitch's hybrids), and Messrs. W. H. Rogers & Son, Red Lodge Nurseries, Bassett, exhibited a magnificent collection of Rhododendrons, which afforded much pleasure and interest to the members, who carefully examined the huge trusses of blooms of varying forms and colours. A vote of thanks was accorded these gentlemen, and also the lecturer, for their services in helping forward the objects of the Association. The meeting was brought to a close after the election of forty-nine new members, which brings the number on the register to about 400.

On the Saturday previous 100 members availed themselves of an invitation from the Rev. R. L. Morris to visit Brook Rectory, with the primary object of witnessing a bee demonstration by the rector, who is an expert apiarist. On the arrival of the party they were met by the Rev. and Mrs. Morris, who had prepared light refreshments, which were much appreciated after a drive of ten miles o'er hill and dale under a scorching sun. The bee members, accompanied by the rector, then wended their way to the apiary, where a practical bee lecture of great interest and edification was given; whilst the horticultural members inspected the gardens and greenhouses, which reflected great credit to the able gardener, Mr. E. Hendy. Previous to their departure for Brook House, the residence of the President of the Association (Sir Chas. Seely, Bart., J.P.), the party was photographed on the lawn, after which a vote of thanks, with rounds of applause, was given Mr. and Mrs. Morris for their kind invitation, and the hospitable manner in which they had entertained the visitors.

On the arrival of the party at Brook House, which is in close proximity to Brook Rectory, the members were met by Sir Chas. Seely and Major Chas. Hilton Seely, M.P. for Lincoln, who conducted them to the orchard house, which is of very large dimensions, where an excellent repast was in waiting, and which received full justice from all. After tea, votes of thanks were given the President and members of his family for the interest taken in the visit of the Isle of Wight Horticultural Improvement Association, and also for their hospitality. The party inspected the pictures which adorn the walls of this palatial residence, also the gardens, stoves, and vineries attached to Brook House, which are ably managed by

the genial and energetic gardener, Mr. W. Tribbick, F.R.H.S. The members were again lined up for photographic operation. Previous to the departure of the party for various parts of the Island, a meeting was held at Brook Reading Room, where the Rev. R. L. Morris gave a short address on bees and bee-keeping.

As the party left cheers were given for the rector and the President. The drive through the well-wooded country lanes of the Garden Isle in the cool of the evening was exceedingly pleasant. On Thursday, June 1st, a large number of the members availed themselves of an excursion to the metropolis with the object of visiting the great Temple Show. They were highly pleased with what they saw, and many of the wrinkles gleaned will assume practical form at the forthcoming Island shows.—S. H.

THE PROSPECTS OF A FRUIT CROP.

AT an earlier period of the spring the prospects of a good fruit crop were very assuring, every kind vying, as it were, one with the other for supremacy. The blossom both on Apples, Pears, Cherries, and Plums were never finer than this year, and taking into account the extreme drought of last summer, the flowers were unusually strong. As is usual Pears which were the densest in flower are now the thinnest in fruit, Pitmaston Duchess, Benrre Clairgeau, and Winter Nelis illustrating this in a very striking manner.

Generally speaking the Pear crop according to present appearances is, or should be, a very good one, yet it would be an uncertain venture to describe it as an absolutely safe one; frost coming as late as this date—the end of May—has been known to change the aspect of plenty into that of extreme scarcity in one single night. In addition to the varieties just named there are others very thin in crop, both in the open as bush or pyramid trees, and on walls. On the whole, however, there should not be any serious break in the autumn and winter supply unless unforeseen troubles intervene to change the prospect.

Apples, perhaps the most important of all English fruits, flowered with the same regularity and abundance, and a casual survey would seem to allay present anxieties. The weather, which for some time has been anything but genial, does not improve much at the time of writing, cold east and north-east winds prevailing continually, and slight frosts experienced on several mornings recently. The generality of trees are now past the critical period, though one or two sorts, including Court Pendu Plat, showed doubtful wisdom in the choice of a late period this season for flowering. The chances are in favour of the early sorts this time; late ones have their opportunity in some years, but their present appearance raises a doubtful thought for full measured crops for next winter. As with Pears, so with Apples, no certainty of crop remains until a later date, but there is every indication that from among the wealth of blossom there remain sufficient apparently swelling to justify the hope of a crop.

Plums, which constitute a most important summer and autumn crop, fared badly while in bloom, and apparently also in a bud state. On many trees on which the first burst of blossom had been made, sharp frosts occurred which it could be seen without very close examination inflicted irreparable injury to those fully expanded; but this, or some other cause, rendered a considerable proportion of the others abortive. On emerging from the flowering stage there seemed to be a large set, but time, which works many changes, has proved very unkind in dealing with Plums. On some trees and sorts there are a quantity about the size of half-grown Peas, and in this state they remain, while those perfectly set have swollen to the size of thrushes' eggs. Many trees are without fruit, and others have very few. The Gages, Coe's Golden Drop, Kirke's, and Washington, which flowered more freely than usual, have only a few scattered fruits remaining; Grand Duke, Prince Engelbert, Victoria, Blue Gage, Pond's Seedling, and Jefferson's are those bearing the most freely.

Cherries flowered as freely as ever, both dessert and Morellos, and what is equally satisfactory, they have set enough and to spare, both on east, west, and north aspects. Here they are neither grown in bush nor standard form, but only on walls. There were no frosts, however, during the time they were in flower; so in the south and west, at any rate, there should be plenty of Cherries.

Gooseberries met with the same fate as Plums, though necessarily at an early date, sharp frosts occurring at the time when their growth and flowers were tender. Some sorts, the smaller ones in particular, have set very well; others, of the Lancashire type, are thinly scattered over the trees. Whinham's have less than half a crop, and the same thing happened last year, and as a consequence, the trees, being comparatively young, are extra vigorous in their lateral growth. So far we have been spared any attack from caterpillars, an immunity we owe to the early visits from the cuckoo. Red and Black Currants are full of promise; Raspberries, a portion of the crop growing on heavy land, show signs of the frost's action on the fruiting canes. The young suekers, too, had their tips browned by the same frosts. A younger plantation on lighter soil does not show the same effects wrought by the cold.

Peaches on the open walls flowered finely, and were overtaken by a very severe frost, which gave the open flowers the appearance of being totally destroyed. There remained, however, a sufficient number to provide a full crop—an agreeable surprise. With coping and a double

thickness of fish nets, blister in the leaf has been almost entirely absent. Apricots are about half a crop; the prospect at the time of flowering did not give the hope of any remaining after the destructive frosts which prevailed at the time.

It is yet early to speak of Strawberries more than to say there is a good show of flower trusses, the plants generally vigorous, and the soil well stored with moisture. Many of the earliest blooms were blackened by the frost of the 27th and 28th ult.—W. S., *Wills*.

THE CARE OF CUT FLOWERS.

THERE is no sweeter sound for the florists' ear than the sharp, crisp rustle of a bunch of fresh Roses, Chrysanthemums, Violets, or Carnations. The rustle tells the story of their quality, perhaps more than any other one point, yet how rare it is, especially in a box of blooms. The care of flowers during and after cutting, during and after travelling, is as important a consideration as their cultivation, and it is useless to try to produce good flowers unless proper care is given them afterwards. Many a splendid bloom has failed of a good sale because of careless handling.

The responsibility of the man entrusted with the care of the stock between cutting and its final sale is second only to that of the grower, and he is fully as difficult a commodity to secure as is the good grower. A prominent Rose grower has stated that one of his most troublesome problems is to find men who know when a bud is ready to cut. This ability is a sort of intuition governed by no exact rule, impossible of intelligent analysis, and imparted with greatest difficulty to even the aptest scholar.

The fewer handlings a flower has to encounter the better, and this fact should never be lost sight of from the moment the bud is first touched to cut it off. All flowers are improved by having the stems immersed in water for a number of hours immediately after cutting. The jars should be of varying depths, sufficient to accommodate a considerable part of the stem, and numerous enough so that any crowding of the flowers can be avoided. The flowers, when placed in jars, must be graded according to length of stem, for, with Roses especially, much damage is done to the shorter stemmed buds by the spines on the stems and leaves of others, and all flowers are subject to more or less damage if irregularly bunched. Wetting of the petals should at all times be guarded against. Carnations and Violets will be ruined by wetting, and Roses are better without it. Violets or other short stemmed blooms when bunched ought to be placed in pans of water, supported by racks of wire, or other construction that will admit the stems to the water but leave the flowers perfectly dry. While on the subject of Violets it may be added that a hood of waxed paper carefully adjusted over each bunch, and left there until they are sold, will do much towards retaining the very evanescent perfume without which the Violet is an unsaleable commodity.

As to the place of storage during the hardening process, it is a matter which does not receive the consideration from the average grower which its importance warrants. A mouldy, musty cellar is no fit place for delicate flowers. In all cases the storage room, whether in a cellar or elsewhere, must be for flowers exclusively, and if with separate compartments for different varieties, so much the better. It must be dry, absolutely free from draughts, and scrupulously clean at all times. It should be sufficiently roomy that the jars will never be crowded together, and so that they can be handled or removed without being brushed against.

Freshness and crispness being of first importance, it follows that the least possible time after they are in good condition should be consumed in getting the flowers from the greenhouse to the customer, and during the time they are in transit every device that will conduce to this end is worthy of adoption and employment. Whether for a short or a long journey, the expert flower packer will provide for the arrival of his goods at their destination in, as nearly as possible, the same perfection in which they start, by packing as late as practicable before despatching time, by acquainting himself fully with starting and delivery hours of trains, by insisting on the co-operation of the companies in the matter of promptness and care, and assisting them to this end by informing them of the perishable character of the stock and by providing convenient boxes with rope or other handles by which they may be carried right side up always. In packing he will take precautions against bruising, breaking, tearing, shifting, heating, freezing, or soaking by packing, so that no flower will come in contact with the side or end of the box or any other avoidable substance, by firming the stems with frequent cleats, and by abundant paper coverings in cold weather.

Roses are best packed in lines, one bud at a time, with layers of soft, non-absorbent paper between each row to prevent tearing of petals or foliage by contact with thorns, and with an occasional cleat of wood fastened across the stems. Some Carnation growers who aim for the best results pack their choice blooms in like manner, giving each individual flower careful attention, and it pays, for, while Carnations will stand more rough handling than some other flowers, yet their recent development has made buyers critical, and they want individually perfect blooms, for which they are willing to pay the difference. In no case should Carnations be tied in bunches of more than twenty-five blooms, and tens or twelves are still better. Callas and Lilies are benefited sometimes by a wad of soft cotton carefully inserted in the flower to help in retaining its shape, but it should be done very delicately.

Boxes must be shallow. Except where Smilax, Ferns, or other

material that will bear crushing is included in the receptacle deep boxes are entirely out of date, for no flower can sustain the crushing of several layers on top of it and be in condition to offer to the critical buyers of the present day. Never despatch flowers in boxes that have been used for coffee, peppermints, salt fish or other odoriferous material.—("American Florist.")

A LOOSE SURFACE FOR PEACH BORDERS.

FRUIT borders of all kinds often get into a close and caked condition by the constant waterings, and in many cases growers are afraid to break this for fear of damaging the surface roots. I am as fully alive as anyone to the necessity of keeping the surface roots intact, and avoid disturbing one of them if it can be helped. But to leave the surface in the condition described above is worse than breaking a few roots, for it is impossible for either air or water to filter through it. Nor is either of these conditions necessary; that is the surface may be kept loose and open without damaging more than a very small percentage of the roots.

A plentiful supply of burnt earth and garden refuse is of the greatest benefit to Peach and Nectarine borders, having a slight manurial value, and being a great mechanical aid in keeping the surface soil loose. Immediately after watering, borders top-dressed with this material may be lightly raked over and tidied, this being quite impossible when not top-dressed, and even when litter has been used the appearance is not the same. Where the burnt refuse is not at command the borders ought to be lightly pricked up with a fork; not deeply, but only just sufficient to break the surface and allow the free passage of air and water. Trees in such borders are much more likely to succeed than others as noted above.—B. S. E.

GOLDEN-LEAVED SHRUBS.

THESE are often rather sickly or poor-looking objects, and many fail to keep true to their characters in the majority of soils, especially those that are heavy and cold. There are some soils which appear to have a peculiar effect in giving rise to golden and variegated forms of plants, and I knew a nursery some years ago that was noted in this way. It often happens, however, that if such variations are not well fixed before sending them out, or they are propagated rapidly under artificial conditions, they soon lose their beauty of foliage.

The Golden Elder is one of the most reliable of the stronger growers, and is invaluable for towns and smoky districts. Amongst smaller growers, but still healthy and free, are two that are not very commonly seen—i.e., *Neillia opulifolia* var. *lutea*, which is compact in habit, 3 or 4 feet high, with small lobed leaves of a bright, clear, and uniform yellow tint. Arranged in a mass in the front part of a shrubbery, or as a separate bed on a lawn, this is a useful addition to the attractions of a garden. A few taller trees of the reddish bronze-leaved *Prunus Pissardi*, rising from amongst these or similar golden-foliaged shrubs, also heighten the effect.

The Golden Mock Orange or *Syringa Philadelphus coronarius aureus*, is another useful shrub, of moderate growth and capital colour, which lasts well. Amongst the Dogwoods and Weigelas we also have some fine golden-leaved varieties, and as a diminutive shrub the golden form of *Ribes alpinum* is a favourite.—L. C. P.

NIGHT-SCENTED FLOWERS.

AMONGST the several comparatively cheap and easily grown night-scented flowers, *Mathiola bicornis* claims a foremost position, and with its congener, *M. tricuspidata*, should have a place in every garden. A few patches of seed distributed here and there over the borders in the spring will afford plants sufficient to pervade the garden each evening with the delicate fragrance of the somewhat insignificant flowers. The flowers close during the day (is it the sleep of the plant?) and are then nearly scentless. Its relation, *M. tricuspidata*, was introduced from Barbary in 1739, and is, in some respects, superior to *M. bicornis*—the flowers are of a slightly deeper lilac purple colour, and remain expanded during the day.

The shrubby Trumpet Flower (*Brugmansia* (*Datura*) *arborea*) also possesses the property of emitting a more powerful perfume in the evening than in the daytime—a proclivity not possessed by its near relation, *B. suaveolens*. The night-flowering Cactus (*Cereus grandiflorus*), holds a leading position as a powerfully scented flowering plant, but it is not so commonly cultivated in our hothouses as it was half a century ago. It is perhaps not generally known that the night-flowering *Convolvulus* (*Ipomoea bona nox*) possesses a very agreeable perfume; while deliciously scented is *Bouvardia Humboldtii corymbiflora*, particularly after sunset.

In addition to the foregoing, the two-spiked Water Hawthorn or Capo Pondweed (*Aponogeton distachyon*) is said to be additionally fragrant at night, as also is *Schizopetalon Walkeri*—a white flowered annual Crucifer from Chili. Doubtless other night-scented plants could be mentioned, but the above alone form a collection worthy of considerable notice to those interested in such sweetly smelling flowers.—W. G.

MESSRS. KENT & BRYDON, DARLINGTON.—We are authoritatively informed that Messrs. Kent & Brydon were appointed on the 1st inst. seed merchants to his Royal Highness the Prince of Wales, the warrant being granted to Mr. John Brydon personally, as trading under the above well-known designation.

THE YOUNG GARDENERS' DOMAIN.

CHRYSANTHEMUMS.

IN nearly every establishment the Chrysanthemum forms a main feature for decorative work during the last three months of the year, and in a few places even January is kept gay by such late varieties as W. H. Lincoln, Golden Gate, L. Canning, and Princess Victoria. The last two named, by careful management, may be had in bloom as late as February when grown in bush form. Presuming a good stock is grown in this form, the plants should now have received the final potting from 5 to 10-inch pots being suitable, using the larger size for the strong growers.

Most of the plants will require the second "stopping" to make them branch, and endeavour must be made to secure some good cuttings from this stopping, as these if propagated on a slight hotbed will make grand little plants for flowering in 5 inch pots: they will require stopping once, and if they make five shoots it will be quite enough. L. Canning is very fine when grown in this way. They can be disbudded or otherwise. We had a plant of Phœbus in a 5-inch pot last November with twenty-seven fully expanded blooms on it, and it remained fresh for three weeks. The cuttings should be inserted not later than the middle of June, and if placed round the sides of pots (five in a 3-inch pot) they will root readily, provided the soil used is sandy. When rooted pot singly in small 60's, and when large enough pinch out the point, and the plants having made about five shoots each, transfer them to their flowering pots—viz., 5-inch. By keeping these in cold frames, syringing and watering carefully, growth will be rapid. If the plants are placed outside in a warm spot and given equal attention to the exhibition varieties, the grower will be rewarded with splendid decorative plants for embellishment of the conservatory or vases.

In the final potting of Japanese and incurved, for exhibition or otherwise, no hard and fast rule should be allowed with regard to the compost, as the texture of the loam varies so much in many places, some gardens having light sandy loam, others heavy. In one establishment I know the best Surrey loam is used, and the "mums" are always worth a long journey to see. The loam we have at command is rather heavy, and not very fibrous, and I will give the exact quantity used, which is sufficient to repot 800 to 9-inch, and 200 to 10-inch pots, from 32's. Perhaps some of the "Old Boys" will feel inclined to criticise the composition, but if they will try a couple of hundred potted in the following soil, I can guarantee grand results, provided, of course, watering, syringing, timing, disbudding, and housing have been systematically done throughout the season. It is as follows: Twenty-four barrowloads of loam, with the fine soil sifted out when chopped, twelve of half-decayed leaf soil run through a $\frac{3}{4}$ -inch sieve, eight of sifted horse manure, previously prepared as for a Mushroom bed, two of lime rubble, two of burnt garden refuse, two of silver sand; to each barrowload is added a 5-inch pot each of bonemeal, Thomson's manure, and wood ashes, with a slight sprinkle of quicklime over the whole; thoroughly mix by turning carefully three times. The third time it is turned a sprinkling of water will almost sure to be needed as the work proceeds, but by no means make the soil too wet and sticky.

If the plants for the day's potting are selected the night before, watered and stood in a partially shaded spot near the bench, the repotting may be carried out without any hindrance. When potted stand the plants close together six rows thick. No watering will be needed for a few days, but the plants should be syringed with water several times daily during hot sunny weather, paying most attention to the bottom portion of the plants, or loss of leaves may result, as the wood is generally hard at the base of the plant at this season. In three weeks or less the plants may be put in their summer quarters, in single rows 5 feet apart. At this time they should all be re-staked, and tied to wires stretched from posts the whole length of the rows. When again well rooted liquid manure and a favourite artificial manure should be applied regularly until the blooms are half expanded. If aphid appear in points of shoots dust with tobacco powder, and vaporise when housed.—FOREMAN X.

FREESIAS.

No plants can, in my opinion, compare with Freesias, either for beauty or for fragrance, while their culture is a simple matter, compared with many others of less utility. The secret of success with these pretty Cape bulbs is they should receive a thorough ripening, without which it is useless to expect a good return in the form of fragrant blossoms. An open sandy compost, consisting of good loam, leaf soil, and some well-decayed manure (that from an old Mushroom bed being the best), with enough silver sand to make the whole porous, is very suitable.

The earliest bulbs should be potted at the beginning of August, these commencing to flower towards the latter end of December. From eight to ten bulbs may be placed in a 5-inch pot, and when potted a good watering should be given. Place the pots in a cold pit or frame, covering the frames with a mat to exclude the light, and as soon as the growths appear through the soil remove the covering. In a short time they must be moved to a house where they will receive plenty of light and air, which are conducive to a dwarf sturdy growth. They should be staked as soon as the growths require it, using thin wire if possible, as being neater in appearance than wood. The plants will be greatly benefited after the flower spikes appear by applications of weak liquid manure at alternate waterings, that made from soaking sheep droppings being the best.

After flowering they must be replaced on the shelves and kept well supplied with water, reducing the supply as the foliage shows signs of decay; an occasional sprinkling of some artificial manure when they are

finishing their growth will be found beneficial, as will liquid manure. They should be allowed to remain on the shelves if possible, but if not a frame will do, provided it is well exposed to the sun where they may get a thorough ripening. When growth has absolutely ceased shake the bulbs from the soil, sort them into the various sizes, the small ones being put into boxes to make flowering stock for another season, and the larger ones can be potted in succession to maintain the supply of flowers.

The varieties generally grown are *refracta alba* and *Leichtlini*, the former being in my opinion the more profuse bloomer and the latter the more fragrant. Both varieties, however, well repay the grower for the best attention, affording as they do plants for decoration in pots, and graceful flowers for cutting in some of the duller months of the year. The flowers last a considerable time when cut and placed in water.—H. C. H.

HARDY FRUIT GARDEN.

Thinning Fruit.—*Apricots.*—The early thinning disposes of the ill-placed, deformed, and undersized fruits. Those behind branches close to the wall or wires, or obviously crowded, are removed first. The removal of these relieves the trees and helps the better fruits to swell. Another thinning will reduce the fruits to a moderate number, and the final thinning should take place after stoning.

Peaches and Nectarines.—Dispense with all small ill-formed fruits as early as possible. Unfertilised fruits do not swell, and must be removed. Any that are inconveniently placed for swelling to a large size ought to be cut off. In the case of two fruits close together one should be removed. Finer fruits are secured by judicious thinning, but leave the final reduction of the crop until the stoning has been completed. The fruits then should not be left less than 6 inches apart, but regard must be had to the condition of the trees, a larger crop being left on vigorous trees than on weakly specimens, the same rule being followed with fruit left on the branches.

Cherries.—Dessert or sweet Cherries on walls may have the bunches thinned if fine fruits are required. Small and imperfectly formed fruits ought also to be cut out. One operation usually suffices for Cherries, but bunches or individual fruits needing removal may be cut out at any time. Morello Cherries set freely, but those fruits which do not swell are best removed for the benefit of the others. Severe thinning of these is not necessary if the trees are in vigorous condition. Good crops can be supported by giving assistance to the roots.

Plums.—Where bunches of fruit are set the least promising bunches or individual fruits may be clipped out. The fruits which take the lead are those which ought to be retained. Remove any close to the wall or likely to be shaded with foliage. It is only wall trees that need the fruit thinning.

Apples.—Fine specimens are not produced by allowing many fruits in a cluster, so in the case of wall trees and small restricted trees in the open a preliminary reduction of the fruits may be made. Well washing or syringing the trees with clear water after the fruit has set is a good method of clearing away the greater part of badly set fruits. At the next thinning the fruits behindhand in swelling may be removed. Finally reduce to two on a spur for fine fruits. The largest are produced by reducing to one.

Pears.—Pears set very freely in most districts when the trees are well established, and choice varieties ought to have the clusters thinned out, and the fruits in these gradually reduced to one or two. In the first place syringing or washing will clear away old blooms and small unfertilised fruits. Cordons and other trained trees on walls, bush trees and pyramids in the open, are capable of producing fine fruits by judicious thinning.

Gooseberries.—Fine fruits for dessert purposes can only be secured by thinning the berries. The choicest varieties may have the berries freely reduced for culinary purposes, carrying out the operation carefully, so as to leave good berries finally a few inches apart, or in clusters of two or three. The thinning should be confined chiefly to a few trees.

Strawberries.—Finer fruits are secured from Strawberries when the small fruits in the trusses are freely thinned. Carry out the operation when the fruit first begins to swell, leaving the more promising. It is good policy to thin out weak and imperfect flowers before the fruit sets, and where trusses of bloom are more numerous than the plants appear capable of supporting, the best only ought to be retained.

Currants.—Red and White Currants do not usually have the bunches reduced or the berries thinned out; but when required to be unusually fine for exhibition, the smallest bunches should be cut out, and any small berries removed.

Regulating Wall Tree Growths.—The removal of useless, ill placed, and gross growing shoots, leaves the trees in possession of medium-sized growths for future bearing and extension. Trees that bear fruit the next season on shoots produced during this must have attention at the present time. The fruits managed on this principle are Apricots, Peaches,

Nectarines, and Morello Cherries. Disbudding is the first process of removing superfluous growths. When the shoots attain to a greater length, those not required must be cut out. The growths retained ought now, therefore, to be laid in, securing them in a temporary manner in the direction they are ultimately to be trained.

Strawberries.—Cut off all runners as quickly as they form on Strawberries planted this spring. The flowers also ought to be nipped out. Where manurial mulching has not been applied to fruiting plants, a layer of short straw should be laid down. Give liquid manure to plants that have set fruit. The later fruiting plants may have a mulching of half-decayed manure containing short straw. Some early runners from young and vigorous fruiting plants ought to be layered into small pots or on turves. Fruiting plants must be well supported by plenty of water or liquid manure. The value of a good mulching lies not only in providing a clean bed for the fruit, but in affording nutriment to the roots, rain and waterings carrying it down into the soil.

FRUIT FORCING.

Peaches and Nectarines.—*Early Houses.*—When trees of the very early varieties, such as Alexander, Waterloo, and Early Louise Peaches, Advance and Cardinal Nectarines, have been cleared of their crops, the shoots on which the fruits were borne, if not required for the extension of the trees, should be cut away to the successional growths from their base, which will allow light and air free access to the foliage. Syringe forcibly to cleanse the leaves of red spider, and if this and scale continue troublesome, the prompt application of an insecticide will be necessary to eradicate the pests. It is highly important that the foliage be kept healthy, and to prevent over-maturity or premature ripening of the wood, it is necessary to keep the atmosphere of the house cool by ventilating to the fullest extent after the fruit is gathered, excepting when the weather be unusually cold and the wood somewhat sappy. Keep the borders moist, and in showery weather remove the roof-lights. Stop the laterals, especially the gross ones, but avoid giving a check by a great reduction of foliage at one time, as this has a tendency to hasten the ripening of the growths, and when such is the case the trees will be swelling their buds, or casting them through over-development when they should be resting.

Trees of Hale's Early, Rivers' Early York, Dr. Hogg, À Bee, Early Alfred and other second early Peaches, with Early Rivers and Lord Napier Nectarines, closely follow the very early varieties, and are now ripening or have the fruits ripe, the house not being started later than the new year. Those varieties are succeeded by Stirling Castle, Royal George, Dymond, and Crimson Gaiande Peaches, with Stanwick Elruge, Goldoni, and Humboldt Nectarines. The fruits are now ripening, and must not be syringed unless the trees are infested with red spider. When water hangs on the fruits for any length of time after they commence ripening, the skin is liable to crack. The trees must not be allowed to suffer by want of water at the roots, but any excess of moisture at this stage has a tendency to cause splitting at the stone. Every care, therefore, should be taken to secure good finish.

Houses Started in January.—Where the trees have been forced for several years consecutively they will have the fruit in condition described in the preceding paragraph, but where they are forced for the first time, or have progressed gently, the finest fruits will now be ripening. The leaves should be turned aside and the fruits raised on laths placed across the trellis, and secured with its apex to the light. This, however, ought to have been effected some time ago, and the fruit will, where that has been done, now have attained a good colour. If the weather prove dull and wet gentle fire heat will be necessary to secure a circulation of air constantly, the temperature being maintained at 60° to 65° at night and 70° to 75° by day. Cease syringing as soon as the fruit begins to ripen or soften, and take care to have the foliage free from red spider before the syringing ceases, as the pest otherwise will increase so rapidly whilst the fruit is ripening as to seriously jeopardise future crops. See that there is no deficiency of moisture in the border, and, if necessary, give a thorough supply of water, mulching lightly with rather short lumpy manure, such as that of a spent Mushroom bed or partially decayed, always sweetened, stable litter.

Succession Houses.—Hurrying the trees during the stoning process is sometimes fatal to the fruit, therefore give time for this most exhausting essential. Allow a free circulation of air, ventilating early in the morning, and close in the afternoon with abundance of atmospheric moisture, so as to raise the temperature to 80° or 85°, and ventilate a little afterwards for the night, the temperature being allowed to fall to between 60° and 65°. This must only be practised after the stoning is completed, as a close atmosphere has a tendency to promote growth, and is not favourable to that process; therefore avoid undue excitement when the trees are in that condition. When the fruits have stoned remove all superfluous fruits, and turn the other with their apexes to the light to insure colour and even ripening from the apex. Allow a rather free extension of the laterals as an encouragement of root action, but be careful not to crowd the principal foliage, and keep insects in check by syringing twice a day. Give thorough supplies of water through a light mulching of lumpy material, and supply weakly trees with liquid manure. Vigorous trees will not need more than a surface mulching, as high feeding will only cause grossness, which must be avoided.

Late Houses.—Train and tie in the shoots that are to carry next year's crop, allowing them to extend to a length of about 15 inches or more if there be space, or stop them at about that size, and pinch laterals to one leaf, being careful to avoid overcrowding. Young shoots required for extension or furnishing the trees should be allowed to extend as far as

space admits, and pinch all side shoots on last year's extensions that are not required for furnishing the trees, so as to form spurs and secure an equal distribution of the sap. In thinning the fruit leave a few more than will be required for the crop. A Peach to every square foot of trellis covered by the trees is ample to secure the finest examples of the large fruited varieties. The medium-sized and Nectarines may be left a little closer. Keep the leaves clean by syringing twice a day, and always sufficiently early to allow the foliage to become dry before night. If insects cannot be kept under by those means, promptly apply an insecticide. Mulch the borders with a little short manure, or if the trees are young and vigorous, lighter and less rich material will be more suitable. Water thoroughly whenever necessary, always giving sufficient at a time to reach the drainage.

THE BEE-KEEPER.

TREATMENT OF SWARMS.

THE closing days of May were remarkable for the favourable change in the weather, the maximum shade temperature during the last three days of the month being over 70°. From early morn to late at night the bees were observed returning to their hives heavily laden with pollen and honey. There being such a wealth of bloom in all directions it is not surprising that stocks increased at a rapid rate.

If the bees have not been provided with extra room in advance of their requirements swarming will now become general. From reports to hand there is not so much difference in the forwardness of stocks in the northern and midland counties when compared with those in the more favoured south. This is doubtless owing to the mild winter and the cold backward spring that has been general throughout the country.

Early swarms must be treated generously if good results are to be obtained during the present season. Should a sudden change take place in the weather, give at least a pint of thin syrup to each swarm every evening. This will enable them to build combs or draw out the cells if provided with comb foundation, so that when a favourable change takes place they will at once commence to store a surplus.

All arrangements should be made beforehand so that there may be no delay in hiving the swarm. As soon as the bees have settled they should be shaken into a straw skep and placed on the ground near the place where they alighted. The skep may be propped up a couple of inches so as to allow the bees that are on the wing to settle down, as it is often impossible to shake all into the skep. They must be shaded from the sun, and as soon as they have clustered in the hive it will be an advantage to place them in their permanent position.

If they are to remain in the skep it will not be necessary to disturb them. But if their future home is to be a frame hive, prop up the hive a couple of inches from the alighting board, place a sheet of newspaper in front of it, and shake the bees into it. A puff or two of smoke will cause them to run into the hive, and in a few minutes they will be comfortably settled in their new home. The reason newspaper is recommended for shaking the bees on is the readiness with which the queen may be seen. Should the queen be left on the ground by accident the bees would not remain in the hive, but would return to the parent stock.

If the bee-keeper is at all nervous about shaking the bees down in front of the hive, the same end may be obtained by removing three or four frames from the middle of the hive and shaking the bees into the open space. Place the quilt over the tops of the frames as quickly as possible, and after the bees have settled down and clustered between the frames the combs that were removed may be replaced. We prefer placing the swarm in their permanent position as soon as possible, as the bees commence working at once.

Some bee-keepers delay the operation till evening. The plan, however, is not recommended, as for several days afterwards bees may be seen returning to the spot where they were first hived. If they are lost much valuable time is wasted. Bees at this season, when honey is coming in freely, will often carry their stores into other hives, and are not molested.—AN ENGLISH BEE-KEEPER.

GROUPING PLANTS IN BORDERS.—Some of the most effective groups for a hardy plant border which I have had for early flowering this year are the following:—1, Strong plants of *Doronicum plantaginifolium* excelsum profusely flowered, arising from a groundwork of *Myosotis alpestris*, which extends well beyond the *Doronicums*, and is also abundantly flowered. This has had an excellent appearance, and been much admired. 2, *Narcissus poeticus ornatus* on a foundation of *Cliveden Purple Pansies*: this is still attractive, as well as another of a similar character, but with deep blue Pansies. 3, The finely variegated and well-known Grass *Phalaris arundinacea*, associated with the blue ordinary variety of *Iris germanica*, placed a foot or more apart, constitutes another handsome but simple bed. Groups of this kind impart much interest to extensive borders.—L.

•• All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," 8, Rose Hill Road, Wandsworth, S.W., and NOT to 12, Mitre Court Chambers, Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor. Letters of inquiry must be accompanied by the names and addresses of the writers, but these will neither be published nor disclosed when initials or *nom de plumes* are given for the purpose of replies.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and it is convenient when each question is written on a separate sheet. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Packing Peaches and Nectarines (W. Raby).—The issue containing the article by "Market Grower" on this subject is out of print. We therefore reproduce it on page 475, as it contains information that will be of service to many readers besides yourself.

Peach Leaves Spotted (Tyro).—The leaves are spotted as if with the sun acting on them whilst wet, as the scorching is different from that caused by fumigation. It has been favoured by insufficient ventilation, the ventilators not being opened early enough in the morning, or the openings not enlarged sufficiently early to allow of the pent-up moisture escaping, and that on the foliage heating correspondingly with the surrounding air. More air and earlier is the only means of avoiding the evil, but it also arises from the foliage being thin in texture, partly due to an unsatisfactory condition at the roots and in part to keeping too close and too moist in the early stages of growth. There is no disease of an organic nature.

Tomato Affected with Scald (A. H. E.).—The fruit is affected by the scald or black stripe fungus, *Macrosporium lycopersici*, which cannot be remedied, as the disease is wholly internal, though it may be prevented by a free admission of air, constantly allowing a circulation, and maintaining a rather warm and dry atmosphere. This procedure has proved the most satisfactory, together with using a little sulphur on the hot-water pipes which gives off faint fumes, yet sufficient to arrest the germination of the fungus spores. Some, however, consider that it is the comparatively dry and freely ventilated atmosphere that gives the immunity from the "scald," the moisture on the fruit giving the fungus the advantage, if not actually causing the "scald," and the parasite takes possession. However that may be, the fungal mycelium is active in the flesh, hence we advise affected fruits to be removed and burnt, and the house to be kept drier, warmer, and more freely ventilated, especially in the early part of the day.

Apple Trees Unsatisfactory (Loughfall).—The portion of small branch and the twigs are in a very bad state, being overgrown with moss, lichen, and saprophytic fungi. There is no wonder the blossoms are small and the fruit has not set. There appears to have been abundance of bloom, showing the trees not to be in a bad state constitutionally, but only requiring a chance. We should wash them thoroughly with lime water, made by slaking a peck of lime and pouring in 30 gallons of water, stirring well up, and leaving three or four days, then using the clear water. It may be syringed over the trees, and will do something to retard the overgrowths. In the autumn, as soon as the leaves have fallen, dust the trees all over with freshly burned slaked lime, choosing a time when they are damp with mist or after drizzling rain, but with a prospect of fair weather. Make the trees quite white. It will not hurt anything but the moss, lichen, and fungi, and that going on the ground will do much good to the soil, which would be the better for a dressing with farmyard manure at the rate of 20 tons per statute acre, leaving on the surface if the orchard is in grass, or pointing in lightly if bare soil. In addition to that, apply a mixture of bone superphosphate and kainit in equal parts, mixed, using 7 lbs. per rod, 10 cwt. per acre, and leave on the surface if in grass, or point in very lightly if bare soil. Then in the spring, as soon as buds begin to swell, apply $1\frac{3}{4}$ lb. per rod of nitrate of soda, which the rain will wash in. This will make a great difference in the trees, and draining being attended to, if needed, should give good results in the future.

Incarvillea Delavayi (J. C. S.).—The price ranges from 1s. 6d. to 3s. 6d. per plant. It may be procured from Messrs. T. S. Ware, Ltd., Tottenham; Barr & Son, Covent Garden; Dicksons, Ltd., Chester; and others. You may be sure of getting satisfactory stock from either of the above.

New Growths of Raspberries (O. F.).—The rootstocks must be allowed to send up new growths or suckers at this season, but they should be thinned out, leaving four to six of the strongest young canes to each stool or rootstock, and the best situated near thereto, removing the other by pulling up, if possible, without prejudice to the parts retained, otherwise they should be cut off. This will give you good bearing canes for another year, if those which bear fruit this year are cut away as soon as the crop is gathered.

Pinching Chrysanthemums (Lancs.).—As the plants are very forward it would be advisable to top them now, and thus rely on the breaks for the buds for taking, or the generally better plan would, perhaps, be to await the first break, then take out its point and rely on the three breaks (topmost) for the buds, removing the others. This would be likely to meet your requirements, though as you practise in a northerly district the pinching would give second break buds somewhat earlier and be the better practice. This is matter for judgment.

Begonia Leaves Disfigured (T. W.).—Yes, the leaves are infested with "rust" parasite, a small creature somewhat resembling a thrips, but far more injurious in its effects. It may be eradicated by frequent vaporisation with nicotine or fumigation with tobacco paper; also by spraying the plants with nicotine essence, one part in 100 parts rain water, or tobacco water. The spray, readily done with an atomiser, should be directed against the under side of the leaves. The parasite has also been overcome by dusting the plants, held upside down, with tobacco powder, using very lightly and repeating occasionally.

Duke of Buccleuch Vine Leaves (H. T. H.).—Beyond slight evidence of scorching near the edges of the smaller leaves, owing, no doubt, to the lodgement of moisture between the lobes during the early stages of growth, there is nothing but pleasure to be derived from an inspection of the specimens. The large leaf is, from its substance and colour, one of the finest we have seen. The few white specks are movable particles which have no doubt fallen from the woodwork of the roof. With a continuation of good culture, by which alone such foliage could be produced, you may, by appropriate pruning, expect good crops and fine specimens of the noble Duke. The small shrinkages of the margins of the small leaves are not uncommon, and may be regarded with complacency under the generally encouraging circumstances.

Stephanotis Unhealthy (H. C. T.).—The most probable cause is defective root action, which may have been induced by the soil being too regularly moist or wet, through the pot occupying a position underneath a stage, on which there are Ferns and various foliage plants, the drainage water from these rendering the soil sodden and sour. It is possible also that the means adopted to free the plants from a "little scale and mealy bug" may have had a prejudicial effect. Such failures, however, are not infrequent after "a mass of bloom," the plant requiring a time to recuperate. We should attend without delay to the condition of the plant at the roots, and if the soil is at all defective repot, using a compost of turfy loam, with a little leaf mould, a free admixture of sand, and a few pieces of charcoal, providing good drainage. Water should be given very carefully or sparingly for a time, never overwatering, but encouraging growth by lightly syringing twice a day. It would also be advisable to cut the plant back, removing the weakly shoots, and encourage vigorous growth by shortening the long and straggling branches.

Liquid Manure for Camellias in Tubs and Pots (Idem).—The liquid is best given when the plants are swelling their buds for flowering and when making new growth; the best we have used is that of sheep droppings, 1 peck to 30 gallons of water, and cow manure 1 peck to 20 gallons of water. The droppings or manure should be scalded, forming into a puddle, then adding the remainder of the water and stirring well, or the material may be placed in a bag. It is desirable to use the clear water only, which will have the colour of ale, and may be used as in ordinary watering. Clear soot water is also good, about half a peck sufficing for 30 gallons of water. It is not advisable to give liquid manure after the buds are set, or stimulate too much, otherwise the plants grow more than is favourable for flowering. The roots must, of course, be quite healthy.

Patchy Lily of the Valley Bed (J. C. S.).—Instead of digging up the bare places, putting in some manure and fresh plants, then covering over with leaves, it would be better to dig up the whole bed in the autumn, separate the plants, with as much root as possible attached to each crown, into sizes, and replant after well manuring the ground and stirring well, but firming the soil again before planting. It would also be advisable to form the beds on fresh ground, preferably with an east or west aspect. In planting a shallow trench should be cut out, the crowns placed upright in it, about 2 inches apart, so that their points are just below the surface, and the soil filled in. Other trenches may then be prepared and planted in a similar way, leaving a space of about 9 inches between them. By leaving out every sixth row beds would be formed, the alleys being handy from which to attend to the plants for weeding and watering. If the crowns are separated into three sizes and planted in separate beds, the small will produce nothing but leaves the following year. From the second size some flowers of medium strength may be obtained. The large ones will for the most part flower, and thus you will secure more satisfactory results another season, and in the following years all will give good returns under liberal treatment.

Fraxinus Ornus (W. B. R.).—This is the name of your specimen, which is also known as *Ornus europea*, and has been popularly designated the Flowering Ash and the Manna Tree. In Dr. Hogg's "Vegetable Kingdom" we find it referred to thus:—"From *Ornus europea*, the Flowering or Manna Ash, the substance called manna is obtained. It is the concrete juice which exudes after wounding the bark. The trees grow spontaneously in Italy and Sicily, whence the finest manna is brought. Manna is a gentle tonic, usually operating mildly, but in some cases produces flatulence and pain."

Does the Stench of Rotten Turnips Affect the Foliage of Vines? (*Vitis*).—We have no experience on this particular point, but we have known the stench from a heap of decayed Brassicas seriously affect Plum trees, Figs, and even Vines in houses to the eastward of the putrefying mass when the wind has been in the west. The gaseous matters evolved were believed to have had the result named, for the foliage was more or less blackened, as if from an overdose of ammonia vapour arising from fermenting materials, and the Vines had every appearance of attack from "browning," the parasite known as *Plasmodiophora* or *Pseudocominis vitis*. It is likely that the stench may have produced the "browning" or given rise to that condition favourable to the parasite, which is a phase of the subject not altogether at variance with the circumstances under which the micro-organism manifests itself.

Narcissus and Daffodil Bulbs after Flowering (*M. S.*).—The foliage should not be cut off when green, but allowed to die naturally each year, and then be removed. It is a bad plan to "dig up the bulbs yearly and dry them in the sun during July and August." The bulbs ought not to be disturbed except for transplanting or division, which operations are best performed shortly after the foliage has died down, as the roots of the bulbs are dormant, and the earlier they are planted again the better. Deferring lifting for the purpose of increase, or to prevent overcrowding until September or later in autumn, causes more or less injury to the new growth. Except for the purposes named permanent clumps should not be lifted so long as the plants grow vigorously and flower freely. At the same time it must be remembered that overcrowding, sooner or later, weakens the flowering of the large bulbs. It is good practice to give an annual top-dressing of loam and decayed manure when the dead foliage is removed.

Grapes Infested with Mildew (*J. D.*).—When the mildew affects the berries and has got a good hold they may be regarded as ruined, and the fungus, especially the form known as *Oidium balsami*, hard to kill. The fumes of sulphur are the most effective, and we can only account for their inefficacy in your case by the hot-water pipes not having been heated sufficiently for giving off sulphur vapour; it is necessary that they be heated from 170° to 200°, and kept so for at least an hour, and the house kept close for that time to retain the fumes, and then the structure should be well aired. Flowers of sulphur dusted on the borders has also proved effective. In case it is used the sulphur must, of course, be washed off before the Grapes are sent to table. Another useful application is prepared by boiling 1 lb. each of flowers of sulphur and quicklime in a gallon of water (not counting that used for slaking the lime and forming a paste with the sulphur) for a quarter of an hour, constantly stirring while it is boiling, then allowed to settle, and the clear liquid poured off for use. The Vines should be syringed with a mixture of this preparation with ninety-six times its bulk of water (1 gill or a quarter pint to 3 gallons of water), and in ten minutes afterwards the Vines must be thoroughly syringed with clear water. Probably the attack is due to ill-ventilation, the Orchids being more considered than the Vines, which require very careful attention in that respect to avoid the pest in some situations.

Names of Plants. (*Ignoramus*).—1, a *Funkia*, but the varietal name can only be distinguished with the aid of flowers; 2, *Saxifraga granulata flore-pleno*; 3, withered, probably *Cheiranthus alpinus*. (*V. W.*).—1, *Odontoglossum Pescatorei*; 2, *O. crispum*; 3, *Oneidium varicosum*; 4, *Cypripedium Lawrenceanum*, poor form. (*R. S. R.*).—1, *Styrax japonica*; 2, *Cytisus scoparius Andreanus*; 3, *Choisya ternata*; 4, *Cytisus præcox*. (*H. F. W.*).—1, *Tiarella cordifolia*; 2, *Amelanchier botryapium* (the Snowy Mespilus); 3, *Spiræa confusa*; 4, *Papaver orientale*; 5, *P. bracteatum*; 6, *Geum Heldreichii*.

Bedding out plants in variety from 3s. doz.

A SOUTH AFRICAN INDUSTRY.

AFRICA; so vast, so huge, so unknown! Ask the average man or woman what he or she can tell you of that great continent. The answers will be short, and mixed—missionaries and blacks, elephants and lions, explorers and miners, intense heat, sharp frosts, high mountains, belts of swamp, Dutch vrows, Portuguese traders, yellow fever and rinderpest, our choicest exotics growing wild, 2s. 6d. the price of a good Cabbage, Oranges for the asking, rushing rivers with golden sands, parching deserts, the glittering diamond and sudden death, President Kruger and Cecil Rhodes—all these subjects would be mentioned were questions of Africa demanded from a room full of people. Yet how little we know of it; possibly some one province is familiar as the adopted home of a dear one; but still, unless that friend is a clever word painter, from his letters we can get but a poor impression of his surroundings.

Though the African day is hot, yet night and early morning are often piercingly cold, so cold, indeed that waggon bullocks will succumb, as Rider Haggard says, from "frost at the heart." Though African deserts are many, yet fertile plains are plentiful too, and some districts are exceedingly well watered. Big game, owing to ruthless harrying, is disappearing before the white man, being driven far into the interior; but the grassy plains are tenanted and support a vast multitude of sheep and goats.

South Africa does not confine itself to one variety of sheep; there is the native and also the imported. The native, as is usually the case in hot countries, is clothed with hair rather than wool, and is noted for its fine caudal appendage, which will often weigh up to 12 lbs. This tail is juicy and fat, and produces a most delicious substitute for butter in the eye of the old Dutch folk; indeed, some people prefer the flesh of the hairy variety to that of the more delicate wool-bearer. The skin of the former is in much request, from its toughness, by bookbinders.

It was in 1790 that we have the first record of woolled sheep in S. Africa, and they were introduced by Colonel Gordon, being the

gift of the King of Spain to the Dutch Government. After we got possession of S. Africa at the beginning of the present century we, as a government, did our best to promote the wool industry, but like many other matters forced on the people by Government, the experiment resulted in failure. People will not be forced against their inclination, and it is fair to suppose those African farmers knew their own business better than a paternal Government knew it for them.

As long as there was labour to be had cheap and plentiful, so long were other branches of agriculture the staple of the country—it was only after the slaves were freed, and the necessity of doing with fewer hands was forced on the farmers, that they turned their attention seriously to the sheep industry. English settlers led the van, and after many preliminary trials hit upon the right sort of sheep most suitable to the climate.

Here as in S. Australia it is necessary to constantly have recourse to new blood from home. The wool goes back to the original hairy texture and loses its true character.

In England more harm is often done to sheep by a too excellent pasture than by one that looks to the unlearned almost bare. By nature the sheep prefers a short, fine, and scanty herbage, and thrives where other stock would pine. Where sheep do the best in S. Africa is where the land will only carry half a sheep per acre. The food that suits them best is the Karoo bush or sweet veldt, so that the best sheep runs are found in the Karoo districts. The plateau covers an area of one hundred thousand square miles, and carries about six million woolled sheep, two millions of "fat tail," and numberless horses, cattle, and goats.

This Karoo bush is a grey green shrub about 8 to 10 inches high, and will grow in regions too dry for grass. As sun does not kill it, neither will frost injure it, so therefore it is available for fodder winter or summer. The reason for its tenacity to life will be found in the extreme length of its roots, which will reach the moisture sooner or later. It must be in character somewhat like the Kidney Vetch (*Lotus corniculatus*), that was at one time in so great demand for the blowing sands of Norfolk, and for other districts where the soil was thin, and ordinary seeds soon "gave up" if the summer came unusually hot and dry.

For this wool there are two harvests in the year (we wonder if clipping by machinery has yet been introduced)? The sheep are washed before clipping as here, and the wool is again washed before being baled at the port of embarkation. This second washing is quite a business to itself, and is carried on at Uitenhage, near Port Elizabeth and King Williamstown.

The Western provinces send their fleeces to Tulbagh Basin. After being washed, it is dried by rotary machinery and compressed into as small compass as possible, with a view to the next stage—i.e., a long sea voyage. It can easily be imagined what power the African sun must have on the drying, or rather bleaching wool; no fuller's soap could have better effect. The chief ports of embarkation are Port Elizabeth for the Free State and Transvaal wool; E. London, Cape Town, Mossel Bay, and Port Natal also export large quantities.

There are difficulties, and great difficulties, for the sheep breeders to contend against. The first is the existence of a tiresome plant of the burrweed type, *Xanthium spinosum*. This burr if it gets entangled in the fleece is perfectly hopeless, and simply ruins its value entirely. Where the plant has come from, for it is not indigenous to Africa, no one knows; when it will be eradicated no one knows, either.

The next enemy we know something of by dire experience—scab; but not the mild English variety, a nice tropical plant that flourishes well in this hot climate. We almost think it might be cured in time, but the Compulsory Scab Act that now exists must be drastically enforced.

Our English chemists have so many and so good remedies, and withal so reasonable, that we think it might be done. But until the farmers themselves are alive to the possibilities of cure not much good can be done. Let them be their own inspectors, convince them that it is a preventible disease, and give them a free hand in the enforcement of pains and penalties, and the thing might soon be done. A

sparse supply of water has been urged as a reason for not dressing sheep. We believe in the efficacy of fatty matter as the vehicle for drugs. We think it is more searching and more certain than water dressings.

There is great complaint, too, about mortality among lambs, and the general delicacy of the flock. That, it appears to us, will in time diminish. It will be a case of the survival of the fittest, and the general stock will become hardier and stronger, and possibly, too, means will be found to prevent such great mortality among the lambs. It is wonderful what a bit of science will sometimes do, and the value of a new food at a critical time of life is often little short of miraculous. We have taken our facts from an interesting article in April's "Windsor," from the pen of Mr. James Cassidy.

WORK ON THE HOME FARM.

Fine weather has set in at last, and appears likely to continue. We are now, therefore, busy sowing Turnips and Swedes, for the land which is put in at once is much the most likely to bring a good crop. At any rate it is working beautifully now, and there is nothing like getting on with work whilst the conditions are favourable. There is abundance of moisture, and a Turnip crop should now be a certainty.

We see nitrate of soda is advocated as a good manure for Swedes, and to a lesser degree for Turnips. We can only say, that from the lessons taught by experience we do not think nitrate is a good thing for the Turnip crop—i.e., in the majority of cases. If it is used at all, it should be in very limited quantity. We have tried various dressings, from 56 lbs. per acre to 224 lbs., in conjunction in all cases with superphosphate and potash; also as an addition to farmyard manure.

Our object in using nitrate was to obtain quickly a strong robust plant. Contrary to expectation we found that the heavy dressing rather checked growth than otherwise; the young leaves were a very dark green, but they did not make rapid progress. Later on in the season they grew well, and developed a large top; but we could not see any increase in the weight of roots in this way over those grown with manure and superphosphate alone, or produced with super and bonemeal.

One thing we did discover, that the Swedes assisted (?) by the nitrate were not of so good a shape as those grown without it, and that they were very much affected by canker, so much so that many of them became quite rotten and useless before they could be consumed.

The experience of a neighbour was exactly the same as ours, though his Swedes were grown on good limestone, whilst ours were grown on weak sand. *Experts crede!* Keep the nitrogen for the grain or Potato crops.

The ewes have been clipped since our last. The wool weighs fairly well, as it generally does after a mild winter, but there is a large proportion of cotted fleeces. As the wool buyers are only offering 9s. per stone for good wool, they will almost wish to beg the cotts.

Surely something must be wrong when good English wool will only fetch 7½d. per lb. Blankets ought to be cheap.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

28th.—Bright sun almost throughout, and clear night.
 29th.—Generally bright and sunny, but cloudy for a time in afternoon.
 30th.—Sun almost throughout, but faint owing to thick haze.
 31st.—Hazy early, bright sun all day.
 1st.—A warm, clear summer day.
 2nd.—Bright and warm, threatening looking clouds in afternoon.
 3rd.—Warm and sunny, but a little hazy.
 A rainless and sunny week, but much haze. Shade maxima high in the second half, but mean temperature not much above the average.—G. J. SYMONS.

PAHLIAS! DAHLIAS!!

Ware's

UNRIVALLED COLLECTION

We are now Booking Orders for Immediate Delivery.

Special attention is drawn to the two following beautiful
NEW CACTUS VARIETIES for 1899.

Early Orders are solicited as the stock is limited.
E. O. GREENING.—Purple, shaded crimson, medium sized flowers, long and twisted petals; very free flowering; 2½ to 3 feet high. 5/- each.

SYLVIA.—Silvery-lilac shaded rose, splendid shade of colour, wonderfully free blooming, a splendid flower for cutting, lasting very long when cut; flower stem long and stiff; 4 feet in height. 5/- each.

NEW CACTUS DAHLIAS, Vars. of 1898.
Including such sorts as:—ARACHNE, CAPSTAN, FALKA, ISLAND QUEEN, LAVERSTOCK BEAUTY, RUBY, &c. 2/- each

CACTUS DAHLIAS, General Collection.
All the leading varieties. Our selection, 5/- doz.

SINGLE CACTUS DAHLIAS (New Type).
Our selection, 5/- per dozen.

DAHLIAS.—Singles, Pompons, Shows, and Fancies, in great variety. Our selection, 5/- per dozen.

BEGONIAS.

SWARE'S GOLD MEDAL and 1st PRIZE STRAIN.
(If required started into growth, an intimation should be given to this effect).

Single—Mixed, 3/- per doz.; 20/- per 100.
To colour, 5/- doz.; 32/- per 100.

Extra choice, for Conservatory or Exhibition, 9/- and 12/- per doz.; 65/- and 75/- per 100.

Named sorts, splendid forms and colours, from 1/6 each.

Double—Mixed, 5/- per doz.; 35/- per 100.

To colour, 8/- and 10/- per doz.; 60/- and 80/- 100.

Gems for Exhibition, 18/- and 24/- per doz.

To name, THE FINEST EVER OFFERED, from 36/- per doz.

DAHLIA CATALOGUE, containing Illustrations of many new sorts, and list of varieties with full descriptions, post free upon application.

N.B.—All Orders amounting to 20/- and upwards when accompanied by cash, are sent Carriage and Packing free.

No. 990.—VOL. XXXVIII., THIRD SERIES.

NEW ROSES.

The Two New Roses Exhibited by WM. PAUL & SON at the Temple Show were—

TENNYSON and CLIMBING BELLE SIEBRECHT
(See Notices of the Press).

Plants of the former can be supplied at 10/6 each, and of the latter (one and two-year old), 5/- to 7/6 each.

Early Orders are solicited as the stock is limited.

Pauls' Royal Nurseries,
WALTHAM CROSS, HERTS.

HARDY FRUITS

A Practical Treatise on the Planting and Management of Orchards, Selection of Varieties, Pruning of Trees, Marketing of Fruit, Manuring, &c. Also a few notes on Insect Pests and their Remedies, by

A. H. PEARSON, Chilwell Nurseries, NOTTS.
Price 7d., post free.

LONDON FERN NURSERIES,
LOUGHBOROUGH JUNCTION, LONDON, S.W.—Ferns, large and small, in variety; Aralias, Grevilleas, Cyperus, Ficus, Ericas, Palms, Dracenas, Aspidistras, Hydrangeas, Pelargoniums, Fuchsias, Marguerites, Crotons, &c. Trade, send for Wholesale List. Special List for Amateurs, send for one.—J. E. SMITH.

ORCHIDS. ORCHIDS.

QUANTITY IMMENSE.

INSPECTION of OUR NEW RANGE of HOUSES, is cordially invited by

HUGH LOW & CO., BUSH HILL PARK, MIDDLESEX.

"SUNPROOF" Shading.

An entirely new Glasshouse Shading, sold in 6d. 1lb. tins, to be washed on the glass with cold water, as if it were soap. Guaranteed to be one-half the price, and to be the only shading in a solid state ready for use without the waste of time and material in being prepared, and to be superior to any other shading. Try it for yourself, and if not entirely satisfactory your money will be returned.

S.M. TREE FASTENERS.—The cheapest and best method of fastening plants and trees to walls. Being made of pure soft lead and not fixed to the nails (like patent wall nails, which when the nails get broken the article is useless), they may be used with ordinary nails for a lifetime. Under 2d. per dozen.

S.M. CLIPS.—To be used in the place of raffia, &c., for tying all plants to stakes, &c. Fastens instantly, and is everlasting, so saves time, trouble, and expense. 1d. doz.

FLOWER GRIP HOLDERS.—The only self-making buttonhole, watertight flower-holder ever invented, and the best for show and other purposes. Price 6d.; ladies', 9d.

IVORINE PLANT LABELS of every Description, guaranteed the cheapest Imperishable Labels, and the wording legible and permanent. Samples free.

WATERPROOF INK, for writing on all kinds of Labels, whether wood or metal. The only ink to stand the outside weather. Price 7d. Bottle.

GARDENER'S FOUNTAIN PEN, filled with the waterproof ink, 1/-.

Send for Illustrated List, with samples, for further particulars and other articles of the

WEST'S PATENT GARDEN SPECIALITIES.

Gratis, "ORCHID CULTURE," per Post.

A Treatise on the Cultivation of Orchids, giving all particulars of their requirements, along with our Catalogue, &c.

THE LEEDS ORCHID COMPANY, ROUNDHAY, LEEDS.

FIFTH EDITION. Price 16/-; post free, 16/6.

SOIL DEPLETION BY THE GROWTH OF FRUIT TREES.

THE fruit grower, whether he produces for home consumption or for market, having secured fruit trees, Vines and bushes, suitable for the purpose he has in view, will find it greatly to his advantage to study the food requirements of the trees he cultivates, not only for the purpose of adding to the fertility of the soil, but in order that he may restore the elements of plant food extracted from it by the crop grown.

Horticultural and chemical science has thrown much light in recent years on the question of manures, and in the research of the requirements of cultivated plants in the garden, the orchard, and the conservatory, that we are able with a degree of certainty, for every 20s. spent in suitable manures, to expect a remunerative return for the outlay.

Few soils can do without manure of some sort in order to yield a maximum crop, whether it be of vegetables, fruits, or flowers. Some, however, are if anything too rich and too forcing for the purpose of fruit growing, and would induce an extravagant growth of stems and leaves to the detriment of the fruit. Such soils usually contain an excess of nitrogen and lime, with a deficiency of potash and phosphoric acid.

Plants, in order to live and fructify, require certain elements of plant food, some of which are supplied by the air and some are found in the soil. Those supplied from the air are combinations and compounds of carbon, hydrogen, and oxygen; they constitute with the compounds of nitrogen and sulphur, which in the case of fruit trees is obtained from the soil, the organic part of the plant, which on combustion, either by fire, fermentation, or putrefaction, returns entirely or partly to the air as gases.

The mineral part of the plant, which is represented by the ashes left behind after complete combustion by fire—as the ash of tobacco or of a cigar—constitute the inorganic constituents, which consist of potash, phosphoric acid, lime, magnesia, silica, soda, sulphuric acid, chlorine, and others.

No. 2640.—VOL. C., OLD SERIES.

In order to determine, as far as possible, the amount of fertilising ingredients taken from the soil by young and old Apple trees and their fruit, a series of investigations has been made by Prof. Roberts of the New York Cornell Experiment Station, of which the following is a summary.

In October the leaves were picked from a thirteen-year-old Wagner Apple tree, from 18 to 20 feet high, and analysed. The total weight was 33½ lbs., consisting of water 16 lbs. and dry matter 17½ lbs., or 52.02 per cent. of the total weight. The dry matter was found to contain nitrogen 1.85 per cent., phosphoric acid 0.48 per cent., and potash 1.76 per cent. In other words, nitrogen 0.29 lbs., phosphoric acid 0.08 lbs., and potash 0.28 lbs.

The year after this analysis of the leaves the tree bore 5 bushels of Apples. The average composition of the Apples is given as water 85.3 per cent., nitrogen 0.13 per cent., phosphoric acid 0.01 per cent., and potash 0.19 per cent. Assuming that for five years there would be borne 5 bushels of Apples annually, that in the next five years 10 bushels annually, and for the succeeding ten years 15 bushels, the following table shows the estimated amount of nitrogen, phosphoric acid, and potash that would be taken from the soil in twenty years by an acre of Apple trees set 35 feet apart, or a total of 35 trees.

FERTILISING MATERIALS TAKEN FROM THE SOIL IN TWENTY YEARS BY AN ACRE OF APPLE TREES.

		Apples.	Leaves.
		lbs.	lbs.
Nitrogen	...	498½	456½
Phosphoric acid	...	38½	126
Potash	...	728½	441

The figures speak for themselves, and show the importance of supplying sufficient and suitable manures to the soil to restore the fertilising materials taken by the trees, and urge the necessity of constant manuring of orchards and fruit trees if paying crops are to be maintained.

An old Apple tree of the variety "Seek-No-Further," practically past bearing, was taken up, weighed and analysed. The composition was as follows:—

COMPOSITION OF THE DIFFERENT PARTS OF AN APPLE TREE.

	Leaves.	Twigs 2 years growth.	Limbs and Trunk.	Roots.
	lbs.	lbs.	lbs.	lbs.
Total weight	232	438½	3972½	840½
Water	139½	218½	1656½	424½
Dry matter	92½	219½	2316	415½
Nitrogen	1	2	5	1
Phosphoric acid	1	½	2	½
Potash	1½	1½	5	1

These results show that the tree, exclusive of roots, weighed more than 2 tons, of which about one-half was dry substance, the greater part being in the limbs and trunk. The tree contained in the above-ground portions about 8 lbs. of nitrogen, 3 lbs. of phosphoric acid, and 8 lbs. of potash.

A thrifty young tree of each of six varieties of Apples, Pears, Peaches, and Plums was analysed, the tops and roots being dealt with separately.

FERTILISING CONSTITUENTS REMOVED BY AN ACRE OF 3-YEAR-OLD FRUIT TREES IN POUNDS.

	Nitrogen.	Phosphoric acid.	Potash.
	lbs.	lbs.	lbs.
Apples	29	10	19½
Pears	24½	7½	14
Peaches	22½	5½	11½
Plums	19½	4½	11½

The result shows that nursery fruit stock removes from the soil only a small amount of fertilising materials as compared with that taken by other garden crops. The usual failure to raise nursery stock with success continuously on the same land is believed to be due to the fact that the readily available fertilising elements have been exhausted by the rapid growth of the fruit stock, and to the fact that the ground is not always cultivated when it is in the best condition.

Lime is known to be a very necessary addition to many soils, as it is a chief ingredient in the ash of fruit trees, though scarcely noticeable in the fruit itself.—J. J. WILLIS, *Harpenden*.

ODONTOGLOSSUM CRISPUM ARTHUR BRISCO.

THE varieties of *Odontoglossum crispum* that were sent from private and professional growers to the Temple Show on the 31st ult. were of excellent average quality and very numerous indeed. We now give in fig. 107 a representation of one named Arthur Brisco that was contributed by Mr. W. Stevens, gardener to W. Thompson, Esq., Walton Grange, Stone, Staffs, for which the Orchid Committee of the Society recommended a first-class certificate. It is a flower of exceptional beauty and merited the admiration that was bestowed upon it by the crowds of visitors. The ground colour is pure white with large and regular crimson brown spots and blotches distributed over the several parts of the whole flower, of which the form is elegant. It is a variety that well maintains the reputation of the Walton Grange collection.

SACCOLABIUM CELESTE.

BLUE being a rare colour amongst Orchids, every species that produces such flowers is acceptable and useful. Although the flowers are not large the spikes are decidedly attractive, and a good plant is

FIG. 107.—CYRTOPIDIUM CRISPUM ARTHUR BRISCO.

very showy. Although *S. celeste* (fig. 108) hails from Siam, it delights in the temperature of an ordinary Cattleya house, and may be grown in perforated pans or baskets suspended in a shady, or partially shaded corner, using as compost live sphagnum moss. Care is essential in watering, as none must remain in the centre of the growth, or irreparable damage will occur; in fact water should only be given in very moderate quantities, especially if the situation occupied by the plant is a damp one.

VANDA DENISONIANA.

PROBABLY many of our readers will not be acquainted with this delightful Vanda, which is not nearly as much grown as it deserves to be. The plant is somewhat like a weak *V. tricolor* in habit, and the flower spikes appear in spring from the upper portions of the stem. Such beautiful white flowers they are, absolutely pure, and the three-lobed lip was likened by Professor Reichenbach to the tail of a black cock. *V. Denisoniana* may be grown with other Vandas in a fairly warm, moist, and shady house; and the roots not being so strong as those of the majority of kinds, the receptacle for them should be of medium size only.

Small baskets, such as are often used for single-stemmed plants of *V. coerulea*, suspended near the roof glass, suit it admirably.

Great care is necessary with the watering all the year round, but especially in autumn and winter, and the sooner the plants can be brought under the influence of light and air in autumn the better. It will consolidate their leaf tissues, and go a long way towards preventing the troublesome leaf dropping so common in *Vandas* in the spring months. This is more particularly noticed in newly imported plants, and others in their second year, the severe check the plants receive during their transit doubtless accounting in a measure for it, while in many cases the plants are collected at a wrong season of the year.

PLEUROTHALLIS ROEZLI.

The *Pleurothallis* are not popular Orchids, but whenever this pretty and distinct species is exhibited it is sure to be admired. The plant is interesting as having perhaps the deepest coloured flowers of any, and these hang downwards from an erect sheathed peduncle. The colour externally is a deep blood purple. *P. Roezli* may be grown in quite a cool house if kept well up to the light in winter and not dried off at the roots. It is a native of the New Grenadan mountains, and was discovered by the successful collector whose name it bears growing "on moss-covered blocks of granite in the neighbourhood of Sanson" in 1874.

AERIDES HOULLETIANUM.

This species used to be more frequently seen than at the present day, but it has never become at all popular. The plant is dwarf, the leaves broad and handsome, and the yellowish flowers, each segment tipped with rosy purple, are very distinct and pretty. Like many others from the hill country in Burmah *A. Houlettianum* does not like a close muggy atmosphere, and though delighting in ample heat and moisture, this must be tempered by allowing plenty of fresh air on all possible occasions. The baskets should be small in comparison with the size of the plant, and good sphagnum and charcoal suffice for the compost.

LAELIA GRANDIS TENEBROSA.

Many hundreds of plants of this pretty *Laelia* have been imported within the last few years, and though unknown a decade or so ago, it has become one of the most popular in cultivation. And rightly, for we have all too few of these rich tints among our Orchids, and besides it is of the easiest culture, provided sufficient warmth is at command. It likes more heat and water, and a slightly drier atmosphere, here than the labiate *Cattleyas*, otherwise the treatment is identical, and the flowers are always plentifully produced as soon as the plants are strong enough.

I know of no other species or kind that will take as much water while the plants are being established as *L. grandis tenebrosa*. The pseudo-bulbs of *L. purpurata* and many others would be absolutely rotten if watered as much as this variety needs, and there is no doubt that many weak plants have been killed and strong ones weakened simply for want of moisture. Over and over again I have warned amateur growers against allowing too much moisture to newly imported plants of various kinds, but with strong specimens of this one they need have little fear, for unless given in inordinate quantity, it cannot harm the plants. When the roots are established in their compost it is different of course, as this holds the moisture longer, but even then a full supply is necessary when growth is active.

ODONTOGLOSSUM LINDENI.

Though a strong growing easily cultivated species, this is hardly to be recommended for general cultivation, being rather shy flowering. When it does bloom it throws up a tall spike containing a dozen or more flowers, each about 2 inches across, of a pale lemon yellow. A native of New Grenada, the cool house suits it well, and being strong growing the pots may be larger than usual, and the compost well drained and rough. The earliest recorded instance of *O. Lindenii* flowering in this country is in 1871, but it had then long been known to botanists.

DENDROBIUM JOHNSONLE.

This is an Orchid of many names, but undoubted beauty, and where it succeeds there is not a more chaste or lovely species in existence. The blossoms are large, and pure white, excepting a few purple markings about the lip, and indeed it is more like a fine white *Laelia* than a *Dendrobium*. It is worthy of every care, and although some of the plants that have been brought to this country were collected at the wrong time, and arrived in wretched condition, there is no doubt it will thrive under cultivation in course of time.

Coming from the neighbourhood of the Torres Straits it must be treated similarly to *D. phalaenopsis* and others from that part of the world, and everyone who has had experience with the class knows that regular conditions as to growth and rest cannot always be laid down. If the plants seem inclined to steady up a bit after flowering so much the better, but if, on the other hand, they start into growth, then the cultivator must follow this up with encouraging conditions of heat and moisture. Ample heat when growing is obviously necessary, and atmospheric moisture will prevent a check and attacks of thrips.—H. R. R.

GLOBE ARTICHOKE.

GLOBE Artichokes cannot be classed as one of the commonest vegetables in the gardens of this country, nevertheless they are much appreciated in some establishments. They are grown to a much greater extent in France than in England, owing no doubt to the more genial climate of that country. Moreover, not only are they much more abundant than Artichokes are in this country, but they are of thicker and more fleshy substance, and there is in consequence more of the toothsome morsel. The cultivated Artichoke is not a distinct species, but a derivative from *Cynara cardunculus*, the Cardoon. It is not found anywhere in a wild state, as we know it in gardens.

The Globe Artichoke can hardly be recommended as a suitable or profitable crop for cottagers, nor for those who only have small gardens,

FIG. 108.—SACCOLABIUM CELESTE.

and need them for more serviceable stock. In most private gardens, however, we find it, and in many it is greatly esteemed, as is the case here; in fact, next to Asparagus it is the favourite dish. In many gardens it does not receive the attention it deserves, as the stools are allowed to remain too long in the same position, with the result that the produce is not only undersized, but stringy, and inferior in flavour. The Artichoke may be grown as an annual, biennial, or perennial; we prefer the latter method. It is much the best to get a good strain, and maintain the supply by planting suckers annually or biennially, as when grown from seed there is such a large percentage of plants that produce inferior heads, although by growing a few from seedling plants the season may be much prolonged.

A moist, rich, deep, and well drained soil is essential, the least suitable being a very heavy one, as there is more labour in preparing it. As the plants may remain on the same spot for a period of four or five years, it is necessary to well prepare the situation in the first

place. The ground should be trenched, preferably in the autumn or winter, to allow it to settle before planting time in the spring, and must not be less than 18 inches or 2 feet deep. To accommodate one row of plants a width of 4 or 5 feet should be allowed, a quantity of good manure and wood ashes being well incorporated with the soil during trenching operations. Seaweed is a good manure, and is much used by those living near the coast.

The position allotted to the plants should be an open one, away from the influence of large trees. If a warm and sheltered border can be spared for a few plants, heads may be cut several days earlier than from those in a more exposed situation. In some gardens Artichokes are planted in odd corners and out of the way places, but the best results cannot be secured by this method. It is a better plan to have them all together where room can be spared, so that they can be more conveniently attended to in the matter of watering, cutting for use, and protecting from frost during the winter. In many gardens there are borders or narrow strips of ground outside the garden proper which may often be used for this purpose.

Planting should take place in March, when the weather is favourable. I am aware that this is earlier than many recommend, but I find the earlier planted grow stronger, as they get well established before the hot dry weather sets in. The usual way is to plant suckers from the old stools, selecting those that have abundance of fibrous roots, although almost any little piece will grow if there is a root at all. I have taken suckers as early as they could be obtained in spring, and established them in pots before planting, but have found little if any advantage by so doing. It is the practice of some growers to pot suckers in the autumn, protect in a cold frame during winter, and plant out in spring, and no doubt by this method heads may be cut earlier than from suckers detached in spring. They should not be planted less than 4 feet apart, and a little more room may be allowed between the rows.

It is advisable to put a stake to each plant, and tie the leaves loosely to it, which will protect them from being broken by strong winds and rain, until they become established. Should dry weather follow planting water must be given occasionally; a thin mulch of manure will also greatly benefit the plants. The only attention required during the summer is the frequent use of the Dutch hoe, with copious supplies of water in dry weather. The plants will then produce a succession of heads during later summer and well on into the autumn. In the case of established plants, when the protecting material is removed in the spring, a coating of manure should be given, and lightly dug in. Liquid manure may also be applied, and subsequently during the summer, for this crop well repays liberal treatment. A dressing of salt can be applied at the rate of 3 or 4 ozs. to the square yard at the time it is first applied to Asparagus beds, and occasionally during the summer. It need hardly be said that the salt is more beneficial on light than heavy soils.

If the plants have been properly cared for during the winter, small heads may be cut as early as the middle of May in a forward season. Last year our first cutting was on May 14th; in the south, no doubt, they may be ready earlier than this. This season they are much later. We have not yet any ready, the first week in June. It has been a cold spring, and all crops are correspondingly late.

For general purposes medium-sized heads are best. If, however, very large ones are required for exhibition or other purposes, the small lateral heads may be thinned. It is said to be the practice of some growers to twist a piece of wire round the stem about 3 inches below the head to increase the size, but not having tried the plan I cannot speak from experience. The heads should be cut as soon as they become of a serviceable size, as if allowed to remain long the plants are greatly exhausted. Artichokes will keep for some considerable time if laid in a cool place, although they will deteriorate in quality.

A few heads may occasionally be cut late in the autumn from established plants, but to get a plentiful supply as late as the middle or end of November it is best to grow a few plants annually from seed. It has already been noticed that the produce of the majority of seedling plants is inferior, the heads being very long and spiny, and the scales thin. All the same these weak points cannot be overlooked when by this method the season may be prolonged for several weeks and Artichokes may be had for nearly half the year.

The proper time to sow the seed is in February, in heat. As soon as the plants are large enough they must be pricked off into small pots. Perhaps a better plan is to sow two or three seeds in small pots, and as soon as it can be determined which is likely to make the best plant the others can be removed. They must be transferred to larger pots as soon as necessary, hardened, and planted out in May. The position should have been prepared some time previously. The plants may be put in singly at 2 feet apart, or in clumps of three at 4 feet asunder. Slight protection must be afforded from late frosts and cold winds, and for this purpose a few small half dead Spruce branches stuck in the ground will be suitable. Water should be given liberally in dry weather, as well as a mulching of manure. If the

season is favourable they will flower in the autumn and produce heads until the middle or end of November.

When the heads are all cut, the plants may be destroyed, or allowed to remain for a second year, when the produce will be much greater. If it is intended for plants to remain more than one year, it will be best to plant singly 4 feet apart, as seedlings grow very strongly the second year. It is generally known that the Artichoke is not hardy, and requires some protection during the winter. When this receives proper attention, the plants grow much better, and produce heads earlier. Some growers are in the habit of cutting off the outer leaves, but this I think is a mistake, unless they are decayed, or broken about so as to be of no use to the plant. One sometimes sees them cut off altogether, but this must greatly injure the stools, and retard growth in spring. Litter from the stables, leaves, bracken, and sometimes mats are used for protection. At one time I used litter, but found it anything but satisfactory. It may do very well where it can be changed occasionally or removed during a spell of mild weather, but if allowed to remain all the winter, heavy rains and snow saturate and weigh it down, which causes the plants to decay. For several years coal ashes have been used here, and I find them answer best, as well as being tidier.

When the heads are all gathered the stems are cut away; the plants then make fresh growth, which I try to preserve, if possible, through the winter. On the approach of sharp frost, a bank of ashes is put round each stool; to facilitate this operation, the leaves are loosely tied together. Should the winter be very severe, more ashes may be added. When they are removed in spring, be careful to clear all away, as it is not advisable to get them mixed with the soil, especially when it is of a light nature. Early in April will be soon enough to remove the protecting material.—J. S. UPEX, Wiggantherpe, York.

HARDY FRUITS—POINTS FROM PEARSON.

MR. A. H. PEARSON once upon a time read a paper at Nottingham, and the wise midlanders seem as if they would not willingly let it die. It was published in pamphlet form, and a copy of the third edition is sent to us—in case, as the author suggests, the hot weather leaves us with sufficient strength to say a word about it—not the weather, but the pamphlet.

There are people in the world, not a few, who appear to think lightly of "little things in paper covers," and who therefore bestow on them only a casual glance, then throw them aside like old newspapers. It is, at least in many instances, a mistake, for a good deal of sound sense and information may be compressed in a few pages presented in modest garb to the public. As by no means all or half of those who are interested in hardy fruit culture will read the score or two of pages under notice, and as the weather is cooler, and we do not remember reading the previous issues, we will consider a few points from the one before us.

PICKING AND STEALING.

It cannot be said that the first point is representative of the highest possible literary morality, but it is at least introduced by the expression of a good old truth—namely, "Much has been written on the subject of fruit culture." It has been said there are some critics who live to deny everything, but we scarcely expect to find one who will deny that pronouncement. The author of it, if author he be, for we think it may have been read a hundred times before, then goes on to say with innate midland modesty that he can hardly expect to say anything new on the subject, but thinks he might "make a nice paper"—note the "make"—and tells us how it could be done. It is delightfully simple and by no means new; it just amounts, we are told, to collecting "gleanings from the writings from others, for as some sly American wit has neatly said—

"He writeth best who stealeth best
Ideas both great and small,
For the great soul who wrote them first
From Nature stole them all."

Our author then proceeds—we do not say "accordingly," but rather to relate his experiences from Nature, art, and negligence in relation to fruit production, *plus*—and we ought to shudder as we write the terrible word and reflect on the law of libel—just a little stealing. "What! a honest midlander steal? It's an outrage; give proof, or into the Court you go, and an intelligent jury shall give redress." Be calm, Mr. Author, we have evidence the weight of which you cannot dispute—your own.

PLOUGHING AND PLOWING.

You tell us that when you first wrote the paper few people thought of planting an orchard and keeping the land in cultivation, and that you "rather" recommended grass orchards; but you have advanced in more ways than one since then, and are not very likely to lag behind. Still, as you say, grass orchards are yet the best in certain

cases, when established in the method described. They are most useful to farmers, but the majority of farmers cannot or will not give them proper, if any, attention in a young state, even if the trees are bought and planted for them, and the trees, though good to begin with, are in a few years torn, twisted, gnarled, miserable wrecks. There are, however, exceptions, and these are on the increase, especially in the chief fruit growing counties and some districts in the midlands. Keep on, Mr. Pearson, in teaching them better methods.

You are now "rather" in favour of cultivated orchard, always for a time, and sometimes continuously, hence you say space must be left, that the "plow" may not come too near them; also in preparing land you point out, for reasons stated, that the steam "plow" may be worse than useless. Now, from whence did you find that advanced word? Not from school, not from your honoured father, not from the *Journal of Horticulture*, not from a good old English dictionary. No, you have been profiting by the poetic teaching of which you cite an example, and stole the word from America, where the people are too busy to put in all the letters. Better stick to the English methods of spelling yet awhile, or when you contract a cold you may be cowing instead of coughing, and to be cowed is quite contrary to your courageous nature.

GIVING.

Quite the obverse of stealing is giving, and you make ample amends for the lapse in orthography when under the phonetic spell, in the good advice clearly given on the various items that cannot be overlooked if success is to be attained in fruit cultivation and distribution. You tell about preparing the land wisely, of planting properly—not omitting to explain that the "quincunx" arrangement of trees is "like five (of spades) on a pack of cards"—on pruning intelligently, manuring sensibly, sorting carefully, and marketing prudently; and, if what you give of your experience on these and other matters is taken and turned to account in the way you wish, growers will not fail to succeed in the production of what is ever in demand—superior fruit, but it *must* be "superior."

SAMPLES.

You have seen baskets of Apples or Plums sent to market with a fine layer of fruit on the top, "the would-be purchaser turns a few over, and finding a different sample underneath begins to thrust in his hands and shake up the fruit; finally, after spoiling its appearance he bids such a price as the smallest is worth, and ignores the larger sized." Of course he does: he would not be much of a buyer if he did otherwise. The marvel is that he is afforded so many opportunities to benefit himself at the expense of blunderers. He just sorts out the better fruit and sells it at thrice the price he gave for the lot, and has the small into the bargain. Well may the practice remind you of the old farmer who said, "When buying sheep don't look at the big ones, but keep your eye on two or three smallest, and buy, then you will be all right."

We rather like the idea of farmers only growing early Apples to be gathered and used, or sold, before harvest, such as Duchess of Oldenburg, Lord Grosvenor, Devonshire Quarrenden, and Worcester Pearmain, with a few Czar and Victoria Plums; but the bulk should be of late varieties, the fruit of which will hang on the trees till harvest operations are completed; or such Apples as Newton Wonder, Bramley's Seedling, New Northern Greening, and King of the Pippins, with Monarch Plum and Shropshire Damson. Another dictum about grass orchards is worth remembering, "Never mow an orchard, as nothing will ruin it more quickly." You might have added, But graze it, and get your friend Mr. Bunyard's three historic crops in one season—wool, mutton, fruit.

A STORY ON DEEP PLANTING.

Apropos of deep planting, the "funniest" story, you know, is that told you by a nurseryman who supplied a number of Cherry trees for a large orchard. Other trees were at the same time obtained from another source. These latter flourished, while the former dwindled. On the perplexed nurseryman visiting the trees he at the first glance failed to recognise his own, and said they could not have come from his nursery, as his trees had 6 feet stems, whereas none of those inspected had stems of more than 5½ feet. Investigation elicited the fact that "the planter had dug the holes for the taller trees half a foot deeper than for the others to *make them all level*."

To this "funniest" story on the subject we will add a funnier. A gentleman made a fine new kitchen garden, and had planted in it a number of fruit trees. Two or three years subsequently he engaged a new gardener—a thoroughly competent all-round man. All the trees flourished except a long row of bush or pyramid Apples along the side of the main walk. We were invited to inspect them. The owner described his gardener as "a capital man in everything else, but he could not grow Apples." Certainly the gardens were in splendid condition under glass and everywhere, but these particular Apple trees, large when purchased at an extra price, were in a miserable plight, with cankered stems and yellow leaves. The gardener said they were planted too deeply, but the owner averred they

were not, he had superintended the work himself, and would not have them lifted. He was told, however, rather firmly, there could be no inspection without seeing the roots, and he marched away. Digging commenced. No roots at 1 foot, 2 feet, 3 feet, but they were reached at last, such as they were. A searching investigation revealed the fact that the trees were standards, but the owner would have them made into dwarfs, "as they would look better and save stakes." He insisted on them being sunk to the outrageous depth necessary, and saw the work done. He was told he had done his present gardener an injustice. "Oh, then you have found me out, have you? Very well, my gardener shall not be bothered any longer, and I will raise his wages." His garden was a pleasure to him, and his gardener a trusted and valued servant to the end. Unfortunately the master is dead, and if Mr. Pearson can find a situation for one of the best of men, where gardening is cherished, and reasonable means provided for its prosecution, he will do better than entering an action for libel against the Editor for saying a "word" about his lecture on fruits.

ONIONS AND MAGGOTS.

Most of us enjoy seeing well-grown Onions, as they are shown at our leading exhibitions, and for this purpose the system of sowing seeds early in gentle heat and, after hardening, transplanting to the open ground, is to be commended. To that I do not object. The method is, however, often put forward as the only sure remedy against the Onion fly, as by this means it is contended the resulting plants are so strong at planting time that they are in themselves able to withstand attacks of this old foe of gardeners. Can the disciples of this doctrine explain away the fact that row after row of Tripolis have become simply lumps of corruption and nastiness? They were strong enough previous to infection.

Passing from this view of the subject, let us look at it from another standpoint. I demur to the universal recommendation of this policy of "boxing" on the score of economy. Think of the thousands of pounds which annually find their way "over the water" for Onions, and it is the market grower we look to for a solution of the difficulty. Will the latter be found in the wholesale sowing of seed yearly under glass? I say no; those who grow Onions to sell at a profit will not be led astray by the tenets of "Onionism."

For some years we have been able to grow the pungent bulb free from its great pest, in a garden which had previously been subject to serious infection, and I propose to give a short account of the manner in which this has been done. I claim to expound no startling theory, no new points of practice, but will give just a plain statement of facts.

It is not for me to strain the credulity of readers as to the weight of crop annually gained from a given number of perches. It suffices that we usually have a small surplus, of which there is no difficulty in disposing at a fair price. With us Onions usually follow late Peas, and as soon as possible after the latter are gathered we bastard trench the piece of ground it is proposed to use. With the bottom spit is incorporated all kinds of garden refuse, from which deep-rooting weeds are rigidly excluded, while a heavy dressing of farmyard manure is added to the upper portion of the land; the whole is well stirred, and then left for the winter.

As early in February or March as it is possible to obtain a good tilth, which all sound cultivators know is essential in sowing small seeds, these are sown. The ground is first well trodden, and afterwards ashes, hot from refuse fires, are spread over the surface, which is then well raked. The seeds are sown in shallow drills 10 inches apart, the rake being again brought into requisition in a light manner, and there is nothing more needed until the seedlings appear. As soon as these can be plainly discerned the Dutch hoe is run down the rows, and a light application of soot given. Ten days or a fortnight from this time an ounce of nitrate of soda, rather under than over that amount, is applied to the square yard. These two stimulants are used alternately until the Onions attain a fair size.

Some of the adherents of the "boxing" system may be tempted to exclaim, "Well! but this is the way to induce soft succulent growth, which is just the condition of affairs the Onion maggot delights in." I quite agree if the applications of nitrate are too heavy, but used in small quantities it will help the young plants to pass quickly out of danger, whilst the soot wards off the parent flies, and so prevents the deposition of eggs.

A word or two about varieties should be added. I have tried numerous sorts, and am bound to admit we have nowadays many good ones to select from: Ailsa Craig, A1, The Reading, Excelsior, and James' Keeping, not forgetting old Giant Zittau. But what will be said of my favourite by the admirers of the great, the massive, and the colossal in Onions, when I tell them its name? Would that it could be written in a whisper, but it must out—Bedfordshire Champion! Let the onionists, if I may call them so, say what they will, I have a staunch supporter in our west country "kitchen genius," who declares them to be "splendid oongyuns." No gardener need

desire greater praise than that for his products, and so long as our need is not in the direction of the exhibition tent and our crops keep clean, as they have hitherto done, so long will such results from the foregoing methods and the old "Champion" satisfy—J. SHALFORD.

SOME EUROPEAN VINEYARDS.

In a recent tour which took me through many Vine growing countries, I had the opportunity of noting the different methods of cultivation. As it was in the spring and before any growth had begun, the Vines were of course in their least interesting condition. Still this enabled me to see all the better the system of pruning and training which had been pursued. I make no mention in this article of the Vine in Southern latitudes. I have seen it on other occasions in Spain, Italy, the Riviera, Algeria, Egypt, and Palestine, but not being at the time so much interested in the culture of the Grape as subsequently, I did not regard it with the same appreciative eye.

To begin with France then, which was where on this occasion I entered upon my travels. I will instance the country round Aix les Bains as a fair sample of the vineyards of Savoy. This interesting old bath town, the Roman Aquæ Gratiannæ, can be extremely hot even at the end of March, for it was not yet April when, after an hour in the hot sulphur baths, I sallied forth for a good square constitutional to see something of the country round about. Whether it was the enervating influence of the bath, or really a burst of extreme heat (the sky was absolutely cloudless with an entire absence of wind), or both combined I cannot with certainty say, but this I know, I have never felt it hotter or my own good shanks' pony less inclined to do work. No, not even in India.

Hence it came about I found myself in a *dolce far niente* condition, and instead of doing a good climb up the mountains which hang over the fertile valley, and pretty well hem it in on every side, as part of my day's proceedings, it resolved itself into a kind of lazy loaf in and out of the vineyards and cultivated plots within a mile or two of Aix itself. After resisting the alluring suggestions, therefore, of an enthusiastic boatman to entice me for a row on Lake Bourget (a really fascinating piece of water), I set myself with what earnest I could summon in my (happily) unwonted torpid condition to inspect the Vines, revolving in my mind the while ideas of a visit to La Grande Chartreuse, which is within measurable distance of this part of Savoy. Trained almost entirely trellis-wise, and all last year's shoots forming this season's bearing wood, generally about 2 feet in length, they are tied perpendicularly straight down. Besides the ordinary trellis put up for the purpose, pollarded Poplars and Mulberry trees, pruned quite close, are much used for twining the Vines round.

In addition to the Vine I saw many other things here. I particularly noted in one little plot a man, a woman, and a child, all Potato planting. While one made the hole, another put in the tuber, and the third covered it up. All the peasants seemed so happy and gay, I could not help my thoughts turning homewards and thinking how little we have of this method and this spirit in our island home; how each year our so-called peasant seems less and less a peasant, even where he is not already almost an extinct species, such a *rara avis* in many parts has he become. Here the whole family were wrapt up in their little holding. There was petite culture of other kinds too, a nice amount of Peach, Pear, and Plum trees being in evidence on most of these plots. I also noticed patches of Indian Corn, which, judging by the old haulm which I saw about, does remarkably well.

But with these exceptions practically every inch of available ground was cultivated with the Vine. It was all very well in the fertile alluvial plain, but one marvelled how Grapes could be produced on the hill slopes in spots that appeared stony and barren of soil, with scorching sun and long periods of rainless drought to contend with. What a contrast to our style of cultivation, with Nature's copious draughts and the rich aid of frequent doses of liquid manure.

The Vines in Switzerland, of which I will take those round the Lake of Geneva as a type, are very different from the French cultivation just described. They were, at the time I saw them, the most unattractive-looking objects, mere stumps pruned quite close to the ground. Even in mid-April I saw no signs of their breaking. They are cut year after year very close to the old root of about half a foot in height, and two or three little rods of another 6 inches or so in length. I noticed a considerable area of Vines travelling through Hungary, and a certain amount in Servia.

The wine of the latter country I thought particularly good. At table d'hôte in Belgrád a clear decanter of either red or white wine is put before each place. Slightly heady, perhaps, and rather strong for a vin ordinaire, it struck me, nevertheless, as being both pure and invigorating.

As regards Bulgaria the culture appeared very rough. Here they

seemed pruned harder back than ever; one had to look very closely in the roughly ploughed fields to distinguish the little black stump among the clods of earth and almost level with the ground.

Travelling into Turkey, especially around Constantinople, the Vine was still to be seen, but to a great extent seemed to have given place to the Fig, which was at the time I saw it breaking into luxuriant foliage, while in Constantinople itself, another kind of Vine, the beautiful Wistaria, was in full bloom, huge growths trailing up and down houses, or making a shady bower or roof over some little Eastern gardens.—J. A. CARNEGIE-CHEALES.

NOTES ON TYDEAS.

TYDEAS, in my opinion, must be classed amongst the most beautiful plants that adorn a warm house. Even in summer they are delightful, and quite distinct from Achimenes. In autumn and winter they are invaluable, and the plants will flower profusely throughout the dreariest and darkest months of the year. They are easily grown, and when well cultivated they will produce their beautifully spotted flowers in succession over a great space of time.

In commencing the cultivation of these plants it is wise to obtain them while in a resting state, and by judicious care in starting some at intervals of a month a supply can be obtained through the whole year. It is difficult when first obtaining the small tubers to adapt them to winter growth. This difficulty can soon be overcome by keeping those required for late flowering at rest as long as possible, and in a season or two the whole stock can be started at any time. It is wise to keep the successions separate, either by labelling or otherwise, or some of those required first may be left, while those for late work may by mistake be potted earlier than intended.

In starting them into growth the small tubers can be placed either in the pots the plants are intended to bloom in, or they may be put in small pots, afterwards transferring them to others 5 or 6 inches in diameter, which are large enough for single plants. The plants do well on either system, but the latter is preferable, as the soil is not so liable to become sour before the pots are filled with roots. If the pots can be plunged in bottom heat so much the better, and the quicker will the tubers commence growth, although bottom heat can easily be dispensed with, and when growth is a little advanced they do as well without it. A temperature of 60° to 65°, regulated according to the outside temperature, is ample if increased as the season advances. During summer slight shade is beneficial on hot bright days, but excessive shading will cause them to grow weakly and flower unsatisfactorily.

As before stated, a few started every month will maintain an unbroken supply. Tubers potted at the commencement of the new year will produce flowering plants by the end of May and through June, and plants started at the beginning of May will bloom by the end of September and through the following month. In autumn and winter they are most useful, and to have a good supply tubers should be potted from May until August; and as the growth is not so rapid during the declining days of the year, those started in August will maintain a supply until late in the spring. When plants have to grow through the winter it is necessary that they should have a light position close to the glass, and care must be taken not to cause a check to their growth.

The pots used should be clean and well drained, a layer of moss being placed over the drainage, then nearly filled with the compost, placing a little sand in the centre, in which to embed the tubers, care being taken to have their growing ends near the centre, and covered with the compost. This should consist of a good fibrous loam, a liberal admixture of leaf soil, a seventh of manure, and sufficient coarse sand to keep the whole porous. Peat may be used as a substitute for the leaf soil if more convenient, but the soil must be light and rich. A number can be placed together in the same pot if large specimens are required, but for all ordinary decorative purposes 6-inch pots are large enough. Tydeas, if properly attended to when resting, make strong growth from very small tubers. When placed in the small pots and the roots reach the sides they should be transferred to the larger size, only removing the drainage, and injuring the roots as little as possible in carrying out the operation. While in active growth the plants require liberal applications of water at the roots, except immediately after they are repotted, when water should be applied with care and judgment until the roots have permeated the new soil. When the pots are full of roots liquid manure may be supplied with advantage. Syringing the foliage is not needed, and indeed the leaves when wet are often injured by exposure to the sun.

The resting period is by no means the least important, and success to a large extent depends upon the treatment then followed. Tuberous-rooted plants of this nature are often neglected by allowing them to remain in cold potting sheds, or by storing them away under the stages. Neglect in this respect brings Tydeas into an unsatisfactory state, and instead of increasing in numbers and gaining strength year by year they become weaker, and in a few seasons are almost useless. If, however, after flowering they are liberally supplied with liquid manure, it will assist considerably in increasing the size of the tubers, which must be plump and matured before resting. The plants must have attention until the foliage commences dying, when they can be kept somewhat drier, and allowed a similar temperature to that in which they were growing. When finally at rest they can be stored in any cool place where a temperature ranging between 35° and 40° can be maintained. Tydeas will not endure being kept quite so dry while resting as Achimenes, —G. W.

RECENT WEATHER IN LONDON.—A distinct change of weather came over the metropolis at the end of last week, for though both Saturday and Sunday were warm they were appreciably cooler than the foregoing day. Monday, though bright at intervals, was colder, while the north-easterly wind of Tuesday was quite searching. Wednesday was dull and cold.

WEATHER IN THE NORTH.—The change to drier and warmer weather which took place a fortnight ago has continued, and the heat has on some days been excessive. Already there is a general wish for rain, as the high winds which have been frequent have caused great drought. On Monday evening there was little appearance of change.—B. D., *S. Perthshire*.

THE ROYAL HORTICULTURAL SOCIETY'S AUTUMN FRUIT SHOW.—By far the most extensive, and in every respect the finest, hardy fruit shows annually held in this country are those arranged under the auspices of the Royal Horticultural Society in the Crystal Palace in the early autumn. The schedule for this year's show, which opens on September 28th and closes on the 30th, is now being distributed. We do not observe that attention is drawn to any new features, nor would it appear easy to devise many of a substantial character. Very good prizes are offered for Grapes, Peaches, Nectarines, Figs, and Plums, but Apples and Pears are naturally honoured with the lion's share. There are prizes for amateurs, nurserymen, gardeners, marketers, cottagers, and, indeed, everybody who may be desirous of competing. The several county prizes afford many opportunities, besides special encouragement, as the first and second prize winners in the sections, have their fares paid from their nearest home station to the Crystal Palace—an arrangement that stands alone amongst inducements, and which cannot be made too widely known in the provinces. Altogether there are 174 classes, and a grand exhibition may be confidently anticipated.

WAKEFIELD PANTON SOCIETY.—Programme of meetings for the second quarter—session 1899. Meetings are held at the 'Strafford Arms Hotel' each Saturday evening at eight o'clock prompt. June 17th, Discussion upon subjects interesting to amateur gardeners, introduced by Mr. G. Bott; 24th, Wild Flower Exhibition, essay by Mr. A. E. Benney, Bradford. July 1st, "The Cucumber," Mr. W. H. Vere; 8th, "Gleaning from the Gardens of Literature," Mr. Rd. Ainley, Morley; 15th, the Rose Exhibition, essay by Mr. G. Hudson, Woolley; 22nd, visit to Rishworth Moors and waterworks; 29th, the Pelargonium Exhibition, essay by Mr. J. G. Brown. August 5th, "The Fuchsia," Mr. G. Dunsmore; 12th, "The Carnation and Picotee," Mr. Geo. Gill; 19th, visit to Hebden Bridge for Hardecastle Craggs; 26th, "The Melon," Mr. J. Thomas. The meetings will be opened by the reading of the minutes at 8 o'clock, and the lectures will commence at 8.15.—T. H. MOUNTAIN, A. S. NICHOLSON, *Hon. Secs.*

TWO SHOWY CALIFORNIAN PLANTS.—Although not cultivated to any great extent, the two plants, *Fremontia californica* and *Carpenteria californica*, are known by repute to most horticulturists as showy flowering shrubs. Like many other good things from the same country, they are not sufficiently hardy to withstand without injury, in the open, any but the very mildest of winters as far north as London, and even with the protection of a wall they are generally killed by a spell of severe frost. In the S.W. counties, however, and in some parts of Ireland they do well, especially if a snug corner can be given them. At Kew a good-sized plant of each has been included among the occupants of the new Himalayan house, and in that place both are now in flower. *Fremontia californica* is represented by a specimen 6 feet high. It is of pyramidal habit, the branches being thrown out at right angles with the stem. The flowers are borne singly from last year's wood; they are deep, rich yellow, and $3\frac{1}{2}$ inches across. The leaves are more or less cordate, rather deeply lobed, and very hairy on the under surface. The example of *Carpenteria* is about $4\frac{1}{2}$ feet high by $3\frac{1}{2}$ feet through, and is thickly covered with upright racemes of pure white flowers. Of the two plants this is certainly the more useful, and is worth growing either as a pot or border plant for a cold greenhouse. If grown in a pot, it will be greatly benefited by being plunged outside for the summer.—W. D.

A RECORD IN "COLD": 421° OF FROST.—It has been stated that in the production of liquid hydrogen, as exhibited by Professor Dewar at the Royal Institution on the 7th inst., an intensity of cold is required which comes within 21° centigrade of the absolute zero, or equal in the common Fahrenheit scale to 421° of frost. At the absolute zero all heat would be exhausted, the rarest bodies would be solid, and all molecular motion would cease. The Professor plunged liquid air and oxygen into the fluid hydrogen, and they became almost instantly a solid like ice.

TREE CARNATION DUCHESS CONSUELO.—Raised by Mr. Whillans at Blenheim, and exhibited at Oxford in June, 1896, under the name of "Admiration," for which it was granted a certificate, this variety passed into the hands of Messrs. Dicksons, Ltd., Chester, who have tested its good qualities. The fine group exhibited by them at the Whitsuntide show at Manchester, called for the highest admiration from visitors. It was named "Duchess Consuelo" in honour of Her Grace the Duchess of Marlborough, and ought to soon be more frequently met with than at present. The flowers are as large as a Malmaison, of a beautiful soft canary colour, and are borne on long stout stems, the branching habit showing each flower perfectly, and adding great weight for grouping purposes. The plant also possesses vigorous growth and free blooming qualities.—R. P. R.

SIDCUP AND DISTRICT HORTICULTURAL SOCIETY.—For a comparatively young society the schedule that has been sent us from Sidcup is an excellent one, from which it may clearly be seen that the object of the promoters is to widen the interest in gardening in the district. Though individually the prizes are not large, collectively they amount to a goodly sum, and should be sufficient to insure a diversified display and excellent competition throughout. There are open classes, gardeners' classes, as well as a cottagers' section, with, at the summer show, seven classes for bees and honey. The respective dates of the two exhibitions are Thursday, July 20th, at The Meadow, Sidcup Place, and Wednesday and Thursday, November 8th and 9th. The Hon. Secretary is Mr. Tyson Crawford, F.R.H.S., Sidcup, who will have pleasure in forwarding schedules to applicants as well as other necessary information.

EVESHAM FRUIT GROWERS.—Our attention is called to a movement having for its object the revival of the Insect Pests Committee. It seems that this organisation lapsed after the great pest of the district, the winter moth, was conquered by the use of Paris green. If the Committee had done nothing more than that its existence would have been abundantly justified. The able growers in the district will be fortunate, however, if they have no more insect foes to conquer or friends to preserve, and it is probable that a consciousness of the need of further investigations in those directions has impelled Mr. Hedges, the indefatigable Mr. Hiam, and other friends, to take steps for the revival of the Committee in question. Miss Ormerod, the consulting entomologist, thinks there is still good work to be done, and certainly great credit will be due to all who effectively co-operate in eliciting and disseminating information that may be of advantage to the fruit growers in and beyond the borders of the fertile vale.

ISLE OF WIGHT.—The Cowes Horticultural Society held, in connection with its last monthly meeting, a members' exhibition of fruit, flowers, vegetables, and plants. The exhibits were numerous, and of first-class quality. Mr. J. Heygate, gardener to Mr. Mumford, The Briary, had a very artistic table decoration; Mr. A. Saunders, gardener to Dowager Countess of Harrington, Stanhope Lodge, staged a collection of plants and a large bouquet; Mr. R. Saunders, florist, staged flowering and foliage plants, also a large quantity of cut flowers in variety; Mr. A. Hills, E. Cowes, arranged a group, with great taste and effect, of greenhouse and stove flowering and foliage plants, intermixed with Palms and Ferns. Mr. W. Guy, gardener to Mr. Godfrey Baring, J.P., D.L., C.C. (Chairman of the I.W. County Council), contributed a bouquet and large sprays of *Viburnum plicatum*. The amateurs and cottagers were strongly in evidence with Peas, Tomatoes, Lettuces, Cabbages, Onions, Asparagus, Cucumbers, Sweet Peas, and Carnations. The principal exhibitors were Capt. Brailley and Messrs. Munt, Rashley, Greenham, K. T. Benzie, S. Benzie, H. Hendy, W. Trivett, C. E. Creighton, and J. Love. The meeting was presided over by Mr. Geo. Fellowes, who, after a few remarks, introduced the County Horticultural Instructor (Mr. S. Heaton), who gave an address on "Exhibitions: Their Objects and Management," which proved interesting and instructive. A unanimous vote of thanks was accorded the Lecturer and Chairman, after which several new members were elected. The exhibition was then thrown open to the public, and was largely attended by the inhabitants of the yacht: g capital interested in gardening.

METEOROLOGICAL OBSERVATIONS AT CHISWICK.

The weather during the week has been remarkable for cold drying winds, mostly from the east. No rain has fallen since May 24th.

— THE WEATHER.—Another very sudden fall of temperature occurred on Tuesday. In London the morning reading of 55° was only 3° lower than on Monday. Later in the day, however, very little rise took place, the maximum reading, 62°, being 7° below the average, and as many as 14° lower than the highest point reached on Monday. Tuesday was the nineteenth day with an almost entire absence of rain in all but the extreme northern and north-western districts. In London it was the twentieth, the drought in the metropolis being now as severe as any recorded since the spring of 1893.—("Daily News.")

— MAY WEATHER AT DOWLAIS.—Rainfall 4.30 inches, which fell on fifteen days. We had rain each day from the 15th to the 25th inclusive, when 3.75 inches fell. Greatest fall 1.49 inch on the 19th. Mean maximum temperature, 61.935°; highest reading, 78° on the 29th. Mean minimum, 38.161°; lowest reading, 26° on the 4th. The readings from the 3rd to the 6th inclusive were 28°, 26°, 27°, and 30° on the 26th and 27th. The wind was in the S.W. on ten days, and in the N. and N.E. on eleven days. There were ten sunless days. Very cold wind throughout the month; everything very late.—WM. MABBOTT.

— MAY WEATHER AT BELVOIR CASTLE, GRANTHAM.—The wind was in a northerly direction twenty days. The total rainfall was 3.50 inches, which fell on fourteen days, and is 1.14 inch above the average for the month. The greatest fall was 0.69 inch on the 23rd. Barometer: highest reading, 30.478 inches at 9 P.M. on the 6th and 28th; lowest reading, 29.144 inches at 9 A.M. on the 15th. Thermometers: highest in the shade, 71° on the 31st, lowest 27° on the 4th and 5th. Mean of daily maxima, 56.38°, mean of daily minima 39.54°. Mean temperature of the month, 47.96°; lowest on the grass, 22° on the 4th and 5th, highest in the sun 124° on the 18th. Mean temperature of the earth at 3 feet, 48.96°. Total sunshine, 187 hours 55 minutes. There were four sunless days.—W. H. DIVERS.

— CYTISUS SCOPARIUS ANDREANUS.—Now that nurserymen are supplying us with plants of this fine Broom on its own roots instead of grafted ones on the common variety, we can see more what the plant is really capable of, and that is making a grand show now. Grafted plants stood still for nearly two years, but those on their own roots planted twelve months later have caught them up and will soon leave them far in the rear. When established it is even more free-flowering than the common Broom, if this is possible, and it makes a really grand display. Although not particular as to soil, there is no doubt all these Brooms like a mixed tilth much better than a very heavy or a very light one.—C.

— AN ADDITION TO EPPING FOREST.—Just a fortnight ago the Duke and Duchess of Connaught dedicated, for public use, an additional 28 acres of woodland to Epping Forest, at the part overlooking Enfield and the valley of the Lea. Mr. E. N. Buxton is the donor of the land, a gentleman who, with his brother, recently presented the Corporation of London with the forest land known as Highams Park. Yardley Hill is the name of the newly added gift. In the presentation address to their Royal Highnesses it was brought out that £330,000 had been spent by the Corporation already in connection with the forest, and an annual outlay of £4000 was required for its maintenance. The opening ceremony was witnessed by many people.

— DEATH OF MR. THOS. J. SALTMARSH.—We learn with deep regret of the death of Mr. T. J. Saltmarsh of Chelmsford, which occurred on the 2nd inst. The deceased was well known and highly respected for his upright dealing in all matters of business, and his loss will be severely felt by his personal friends.

— ENGLISH *versus* FOREIGN APPLES.—Although a staunch supporter of English fruit, I must acknowledge that there is something about the quality of such Apples as Tasmanian Newtown Pippins which so pleases the British public that they will buy them freely in March, and will not even look at the examples of English growth at that time. It is all very well for some persons to tell us how to supplant the foreigner in Apple culture, but I fancy if they had to practise the sale of home-grown Apples they would relate a different tale. I know from experience that even Cox's Orange Pippin in good condition is difficult to sell when "foreigners" come into the market, especially at a long price. For this reason I do not advocate the planting of late varieties. Plant early and midseason sorts, and sell them direct from the trees before there is time for the fruit to depreciate by storage.—E. MOLYNEUX.

— CLERODENDRON FALLAX.—Although among the brightest and best of stove plants, this Clerodendron is not given the attention it deserves. There are many places, it is true, where its culture is taken up with spirit, and a speciality made of good stocks of plants to follow each other nearly the whole year round. But they are in the minority unfortunately, and there are many hundreds of large gardens where the plant is absolutely unknown. To grow *C. fallax* well a strong moist heat is necessary from the time the cuttings or seeds are inserted until the flower racemes begin to show colour, when rather less moisture is necessary in the atmosphere, and the plants may be removed to a cooler structure to conserve the flowers. Many plants are injured by being kept too cool in the winter, and plants in flower ought not to be taken to dry and draughty conservatories or rooms, or they are injured, and will show it by the young shoots drying off instead of extending. Very loose potting is not advisable, but the leaves are larger and handsomer when they grow rapidly, so no great amount of ramming need be practised. Good fibrous loam and a little peat or leaf mould, with a sprinkling of coarse sand and a rather liberal addition of either dried cow manure or a good concentrated fertiliser, will make a suitable compost for the plants. Be very careful to keep insects in check, as these will soon ruin the finest plants.—C. H.

— A SIMPLE WAY TO TELL IF SOIL NEEDS LIME.—The following methods have been taken from Bulletin No. 59 of the New Hampshire College Experiment Station by our transatlantic contemporary "Gardening," and are so simple and inexpensive that they can readily be used by every gardener in testing his compost heap and potting soil:—"A tablespoonful or more of soil is placed in a tumbler or eup, and moistened with sufficient water to make the mass of about the consistency of a thick paste. It is best to allow it to stand for from fifteen to twenty minutes before making the test, though it may be made at once. With a knife blade part the soil, and introduce one end of a slip of blue litmus paper (a few pence will buy enough to make many tests), which may conveniently be one-half to three-quarters of an inch wide and 2 inches long, press the soil about the paper, and after from two to five minutes remove the paper without tearing it, rinse off the adhering soil with water, and note whether it still retains a blue tint or has become positively red. If the paper has been strongly reddened, it may be concluded that lime will probably benefit many crops which may be grown upon the soil. If the soil has a marked reddish tint, as is sometimes the case, it may be better to bring but one side of the paper in contact with it; and if a red colour comes through to the other side it may be concluded that the soil is acid. In all cases care must be taken not to handle the end of the paper which is used for making the test, since the touch of the fingers may redden it, and thus one might be deceived. By another method a teaspoonful of soil is stirred into a glass of water to which a few drops of ammonia have been added, and the whole set aside for some hours; the liquid which remains at the top will be nearly colourless, but where lime and magnesia are lacking in a soil the liquid has usually a dark brown or black appearance, the intensity of colour depending upon the amount of soil taken, and of course upon its need of lime." Wood ashes contain a large amount of lime in a very available shape, as well as other valuable fertiliser ingredients. When they are not at hand air-slaked lime can be used. It must be remembered that lime mixed with manure, bone, or any substance containing ammonia will set the ammonia free to pass off in the air and be wasted. In using lime or wood ashes they should be mixed with the soil before the other fertilisers are added, and the soil allowed to stand for some time.

— **PRESENTATION TO MR. ALEXANDER DEAN.**—Our correspondent "A. D." was on Saturday last, on the top of St. Ann's Hill, near Chertsey, presented by the Committee of the Kingston Total Abstinence Saturday Popular Entertainments with a handsome silver-plated inkstand, as some recognition of his services to them in organising these entertainments with such marked success during several years. The inkstand bears a suitable inscription. Mr. Dean's first presentation of this nature was in the form of a silver watch, given to him by the Committee and friends of the Shirley Horticultural Society (Southampton) in 1870, which he did much to organise in 1865, and it has remained a very active, energetic society to this day. Two other presentations have been made to him since, besides the one given on Saturday last, so that he must be regarded as a fortunate man, whose labours do not go unrecognised. Our versatile correspondent does not in the least mind who knows to whom the familiar initials belong. He has done effective work in the cause of temperance.

— **ANOTHER BULLFINCH CHARGE.**—I think most people are loth to put forth evidence against this beautiful member of the feathered tribe, but the truth must be told, and he is a mischievous fellow when once he commences his depredations. The person whom he loves to worry most is the fruit grower, and the way in which he will persistently strip the buds from fruit bushes is now an old story. But his habits of mischief do not begin and end among the fruit, and quite recently I was in a garden where I noticed how scanty were the flowers on both the white and purple Lilac trees. I passed some remark on this, and was surprised to learn that the direct cause was the bullfinches. The trees early in the spring, so the gardener told me, were well stocked with buds, and the promise of bloom was abundant, when he noticed the bullfinches began to be very busy among the Lilacs. Apparently they found something to their liking, and did not relax their efforts until they had deprived the trees of the majority of the buds.—G.

— **MR. WM. PAUL, V.M.H., AND THE CHESHUNT MAGISTRATES.**—The experiences of Mr. William Paul, the well-known nurseryman, at the Cheshunt Bench this week, are calculated to induce him never again to perpetrate the offence of summoning before the magistrates persons who commit depredations on his property. He possessed in his nursery at Wormley a fine Araucaria. On Easter Sunday the tree attracted the attention of four youthful excursionists from London, who seem to have said, "Here's a tree, let's spoil it;" and spoil it they did by cutting branches off. They were caught, summoned before the Bench, and ordered each to pay 1s. 3d. damages and 2s. towards costs. As the prosecutor had to pay 16s. for the summonses and 2s. for the subpoena, total 18s., and as the excursionists were only made to contribute 8s. towards costs, Mr. Paul loses 10s. In other words, the prosecutor, who was the injured party, is mulcted in more than three times the penalty which was inflicted on each defendant by way of damages and punishment.—("Herts and Essex Observer.")

— **NATIONAL DAHLIA SOCIETY.**—The Committee of the above Society has made arrangements to hold a meeting at the Royal Aquarium, Westminster, on Tuesday, September 19th, for the purpose of affording an additional opportunity for the exhibition of seedling Dahlias, and for the awarding of the Society's first-class certificate to such of the new varieties exhibited as the Committee may consider worthy. In order to give additional interest to this meeting, it is thought desirable to offer prizes in a few competitive classes, and several amounts have been already promised. It is earnestly hoped that members of the Society will contribute to the special prize fund, so that an exhibition worthy of the Society may be provided. The Directors of the Royal Aquarium have undertaken to provide ample accommodation in the galleries of the building, to furnish all the necessary staging, to issue posters, and advertise the Exhibition in the daily and weekly papers, to give passes to exhibitors, and supply tickets of admission to the building to members of the National Dahlia Society and their friends at half-price. But they stipulate for a two-days exhibition, to which the sub-committee appointed to make the necessary arrangements has consented. Miscellaneous trade exhibits are invited, for which a moderate charge for space will be made as a contribution towards the expenses of the Show. Subscribers of 2 guineas to the prize funds can exhibit miscellaneous contributions free of charge. Subscribers to the special prize fund will not be charged an entrance fee in order to compete, non-subscribers to the fund must pay an entrance fee of 2s. 6d. The amount offered in the suggested schedule is £22 10s., but this is contingent upon the amount being subscribed. Dahlia lovers must, therefore, come to the assistance of the Society and send subscriptions to the Hon. Sec., Mr. J. F. Hudson, The Gardens, Gunnersbury House, Acton.

— **ROYAL METEOROLOGICAL SOCIETY.**—At the ordinary meeting to be held in the rooms of the Society, 70, Victoria Street, Westminster, S.W., on Wednesday, the 21st inst., at 4.30 P.M., the following papers will be read:—"Heavy Falls of Rain recorded at the Observatories connected with the Meteorological Office, 1871-1898," by Robert H. Scott, D.Sc., F.R.S.; "Average Height of the Barometer in London," by R. C. Mossman, F.R.S.E., F.R.Met.Soc.; "A new Self-recording Anemoscope," by Joseph Baxendell, F.R.Met.Soc.

— **PELARGONIUM RADULA.**—This is one of the best of the scented-leaved section, as it does not grow quite so strongly as many, yet has a more filled-up look than the very fine cut kinds, such as Pheasant's Foot and similar ones. It has the merit of standing much longer, too, in the house than most, and a plant that has been standing on my table all through the winter is now quite fresh and green, and growing at all its points. It is getting late for propagating, but there is yet time to obtain plants for use in late winter and spring. Their culture is easy where good light house or frame room can be spared, and they are very useful when indoor furnishing has to be done.—H. BURY.

— **THE STRAWBERRY SEASON.**—Strawberries are already coming into the market, and if some showers fall, sufficient to moisten the ground without gritting the fruit, it is likely that we shall have an adequate supply. Strawberries love moisture, and the rain that fell towards the latter part of May did much good to the plants. Growers have, however, great difficulty in getting Strawberry pickers, and the same may be said of Gooseberries. The fact is, says the "Rural World," these hands are getting fewer every year—so much so that many fruit grounds have been seeded down to grass that might have been still used for market gardening if labour had been procurable.

— **LATE BROCCOLI.**—From whence come the remarkably fine heads of Broccoli now in the market? There is one before me, bought from the neighbouring greengrocer, of fine massive proportions, fully 9 inches over the white head, and weighing from 3 to 4 lbs. Surely such superior heads could come only from a northern district on June 10th. I know we have late varieties in Model, Late Queen, Methven's June, and others, but these have all been over, in the south at least, since the end of May, and what were seen then were very small. I hear of a very fine late selection from Bucks in a private garden, but such a sample as the one before me has come from some market-grown breadth no doubt. But where? Will some northern correspondents tell us whether they have white Broccoli well into June in Yorkshire or in Scotland?—A.

— **GIGANTIC ASPARAGUS.**—Several bundles of very fine Asparagus were recently disposed of in the Birmingham Fruit and Vegetable Market by Mr. Thos. Howell, garden produce salesman. It was grown at Evesham for prizes. The heaviest bundle of 100 heads weighed 25½ lbs., and was about 20 inches in length. Other bundles weighed 24 lbs., 23 lbs., 19 lbs., and 14 lbs. respectively. A heavier than either of the above was forwarded to London from Evesham. It was stated that one or two of the foregoing examples were bought for presents at a sovereign each, and others at 30s. a couple. It would be interesting to know if there have been recorded weights exceeding those in question elsewhere.—W. G. [We have seen no such elephantine Asparagus as the extraordinary weights imply, and so far as we know they are unequalled. The stems must have been earthed up to an unusual height to have obtained a length of 20 inches, and the scales remained closed, as they presumably were, to be of exhibition quality. Evesham is evidently in the ascendant in Asparagus culture.]

PATCHY POTATO PLOTS.

I CANNOT easily recall another season when there were so many complaints of the uneven and patchy aspect presented by Potato quarters, either in garden or field, as this year. There are, it is true, exceptions, where no signs of failure occur, but among the cottage, allotments, and larger gardens I have seen many cases. Some "sets" have never come up at all, but are tubering without foliage. This blindness is somewhat difficult to understand in my case, because the seed was in good condition for planting.

A selection of the old Ashleaf is the worst offender among the earliest section, but Beauty of Hebron and Snowdrop are equally as irregular among the maincrop plantings. I can only attribute the failing to the excess of rain which followed the planting, causing the ground to be cold, particularly as the night temperature ranged so low. I had always looked upon the old Ashleaf as a hardy Potato, but it has this season, for some reason, acted falsely, and allowed Sharpe's Victor and Ringleader outstrip it in that respect. These, as well as Harbinger, First Crop, and Veitch's Ashleaf come up well, and did not suffer so much from spring frosts as usual.

I should like to ask "A. D." whether in his extensive plantings he has found many such failures as noted above.—W. S.

COMBATING RED SPIDER IN VINERIES.

RED spider is without doubt one of the most troublesome insect pests which Grape growers have to contend against, and if no such insect existed well-coloured Grapes would be more common than they are at the present time. How often may we meet with a house in which the Vines look extremely promising up to a certain stage, then red spider puts in an appearance, and through failure to check it in time, the berries neither swell to their full size nor colour perfectly. Those who have under their charge Vines which are trained 2 or 3 feet from the glass ought not to have much difficulty in combating this enemy, provided the Vines are in a satisfactory condition at the roots, and that their general treatment is sound. Water must, of course, be given in abundance when needed, also high feeding practised, and I opine that when these conditions are found in combination red spider is not much dreaded.

Unfortunately there are many cultivators not so favourably circumstanced. They have to do the best they can with Vines trained so close to the glass that the leaves touch it; in each instance attacks of red spider are inevitable, and the order of the day should be to watch for the first signs of the enemy and take effective measures to stamp it out. These signs may often be noticed while the Grapes are being thinned, and the common practice of keeping the atmosphere of the house very dry during the flowering period favours the spread of red spider. I am convinced that in time all Grape growers will be fully alive to the fact that the ancient practice of maintaining a dry atmosphere at thinning time is one of the greatest mistakes which can be made; all that is needed is to have the atmosphere fairly dry and buoyant at noon; heavy morning and afternoon dampings of the house are of the greatest advantage.

As the work of thinning proceeds a sharp look out should be kept for insect-infested leaves; when such are found sponge them thoroughly with a weak solution of softsoap and water. It is an easy matter to keep a tinful ready mixed in the house, and a little time spent in combating the enemy then will prevent much anxiety, and perhaps hours of labour at a later stage.

At one time I had an aversion to syringing Vines, but have since found the beneficial effects of the practice when well carried out; and, if after having first sponged the infested leaves, I find the pest still spreads, I do not hesitate to syringe thoroughly at closing time during bright afternoons. By this simple practice alone I have frequently completely mastered red spider, and brought the leaves into a thoroughly healthy condition again. If clean soft water is used, and care taken to force it between the bunches, the berries are not marked or spotted in the least. Water falling from the leaves on to the berries never seems to mark them; it is only when it is forced directly on to the bunches from the syringe that the bloom gets rubbed off. A deft manipulator of the syringe can easily avoid the latter error.

I never like to resort to painting the hot-water pipes with sulphur, and then heating the water to boiling point, as it entirely takes away the freshness of the leaves, leaving the edges of them rusty, and impairs the colouring of the Grapes. I am well aware that the plan is regularly practised in many large Grape-growing establishments, and good as the produce sent out from such places is, I am inclined to think the "finish" would often be better were this method of killing red spider not followed. There is really no necessity to take such drastic measures now, even in the case of a bad attack, for fumigating with XL All vaporiser will kill the enemy quite as well. A strong dose must, however, be given, and in houses containing Muscats it is not safe, as the tender foliage of that variety is easily injured. A fuming sufficiently strong to be effectual seems to distress though not mark the foliage of other varieties, and except in the case of a bad attack, in which all other remedies failed, I like if possible to manage without fumigating, but, nevertheless, XL All, I am bound to admit, is the best remedy I have yet tried for a desperate case.

Other aids towards accomplishing the objects in view are the following: Pay especial attention to early ventilation, so as to prevent the temperature of the house from rising rapidly, a condition extremely trying for leaves near the glass. By admitting the cool early morning air the leaves seem to be invigorated for withstanding the heat of the hottest day, and the temperature of the house is easily kept down to a desirable point. Also encourage lateral growth, which will, by increased root action, aid in the case of black Grapes approaching the colouring stage, training in between and under the main leaves every lateral that is formed. Although, contrary to advice usually given, I have proved to my own satisfaction that such additional growth, although it may not be fully exposed to light, is beneficial to the general health of the Vines at that stage, and Black Hamburgh Grapes invariably colour better under a heavy than a thin canopy of foliage.

Water at the roots must, of course, also play an important part in combating red spider; when the border is approaching dryness, give copiously rich brown drainings from stables or cowsheds, and do not neglect to mulch the border with short cow or stable manure.

—H. DUNKIN.

"WOOD AND GARDEN."*

THOSE who look upon gardening as something more than a means of earning a livelihood will thank Miss Jekyll for giving us in this charming book the results of her thought, observation, and practice for nearly thirty years. It cannot be said that the plan of the book is entirely new; for others, known to readers of garden literature, have preceded Miss Jekyll in a somewhat similar method. Yet her book is no imitation, but is full of freshness and originality. Even had the work not had on its title-page the name of one known by reputation to all British garden lovers, the introduction with which it opens would be a sufficient passport, and would by its manner and matter induce a perusal of what follow. This is a series of twelve chapters upon the months, with their trees and flowers, and several others treating of such subjects as "Large and Small Gardens," "The Flower Border and Pergola," "The Primrose Garden," &c.

The master-spirit of the book may be learned from the introduction. It shows itself in various ways, but through all these runs the desire expressed in the following words: "The lesson I have thoroughly learnt, and wish to pass on to others, is to know the enduring happiness that the love of a garden gives." Whether the authoress emulates Jefferies in her word-pictures, speaks of her garden methods, discusses colours and their arrangement, or the vexed questions involved in the relations of master and man, this wish is plainly evident. Critical, too, as Miss Jekyll can be—the views she holds regarding flower shows tell as much—her notes of criticism are softened by that toleration which shows itself in the words with which a passage referring to the various styles of gardening is closed: "And all are right and reasonable and enjoyable to their owners; and in some way or degree helpful to others." Not everyone will admit as much.

"Wood and Garden" is not a book which can be taken up, read through hurriedly, and then put away. There are passages which show us that had Miss Jekyll cared to confine herself to the purely picturesque or "word-painting" aspect of her subject, she would have given us a book which would have been as highly appreciated by many as the present one will be. It might, and probably would, have been less useful, and could not have fulfilled the aim expressed in the words quoted from the introduction. It would, however, have given delight to the many who, relishing what is provided, eagerly wish for more.

To illustrate this, had it not been for the length of the quotation required to do it justice, we might have quoted a passage from the chapter on "January." It describes the woodland with its "warm carpet of pale, rusty Fern," its "colour harmonies of grey bark and silver-grey lichen, only varied by the warm, feathery masses of Birch spray." And how well we are told of the "sombrely cheerful" Holly, and the "silver-barked Birches." Many equally beautiful descriptions occur. We must ever think gratefully of the Nut-walk at Munstead for being the means of giving us in the same chapter a delightful account of a visit paid by the authoress to the Cobnut nursery at Calcot, near Reading. It is remarkably well written, and it will not do to spoil the picturesque scene by a partial quotation. No one is likely to forget readily Miss Jekyll's picture of the quaint nursery, with its tender-leaved Nut trees in their earliest greenery; the great chained mastiffs; the "brawny wholesome forewoman," and Mr. Webb, its trim old master.

It may be noted, too, as worthy of special remembrance, the mention of the blooming of *Lilium giganteum*, and the description of the plant and its flowers. Only an enthusiast who knew this giant Lily well could have written of it thus:—"In the evening the scent seems to pour out of the great white trumpets, and is almost overpowering, but gains a delicate quality by passing through the air, and at 50 yards away is like a faint waft of incense. In the evening light, when the sun is down, the great heads of white flower have a mysterious and impressive effect when seen at some distance through the wood, and by moonlight have a strangely weird dignity."

A pleasant and, what is more, an extremely useful chapter on "June" is largely devoted to Roses. Perhaps it is only those of us who dwell in the country who can enter into the spirit with which the authoress begins the chapter. "What is one to say about June—the time of perfect young summer, the fulfilment of the promise of the earlier months, and with as yet no sign to remind one that its fresh young beauty will ever fade? For my own part, I wander up into the wood and say, 'June is here! June is here! Thank God for lovely June.'" Happy in having such a neighbour is Mrs. Edgeler, whom Miss Jekyll has photographed as she picked her bunch of Roses from her old standard bush (see illustration, fig. 109).

* "Wood and Garden." London, Longmans, Green & Co., Paternoster Row.

Column after column might be culled from the tale of the months, but only one or two more extracts can be taken. Of Dahlias as garden flowers Miss Jekyll, in speaking of the defects of many flowers, pretty in themselves, but of bad habit, says:—"For however charming in humanity is the virtue modesty, and however becoming is the unobtrusive bearing that gives evidence of its possession, it is quite misplaced in a Dahlia. Here it becomes a vice, for the Dahlia's first duty in life is to flaunt and to swagger, and to carry gorgeous blooms well above its leaves, and on no account to hang its head."

From "October" the following is taken as an example:—"Passing along the wide path in front of the big flower border, and through the pergola that forms its continuation, with eye and brain full of rich, warm colouring of flower and leaf, it is a delightful surprise to pass through the pergola's last right-hand opening, and to come suddenly upon the Michaelmas Daisy garden in full beauty. Its clean, fresh, pure colouring of pale and dark blue, strong purple, and pure white, among masses of pale green foliage, forms a contrast almost startling after the warm colouring of nearly everything else; and the sight of a region where the flowers are fresh and newly opened, and in glad

but the more we know the more we see the truth of what Miss Jekyll says, "The more ignorant the questioner, the more difficult it is to answer helpfully." Most amusing is it to read of the ladies who had got a simple border plant and "had made a nice hole with their new trowel," and had bought and emptied into the hole a "whole tin of Concentrated Fertiliser!" Yet the plant died! The chapter on the "Flower Border and Pergola" must be read as a whole. It is hopeless to attempt to convey in a few words its suggestiveness and value.

Miss Jekyll's Primroses are well known, but one of the shortest of the divisions of the book is devoted to her Primrose garden. Long before we come to this we have learned that the authoress is, what she terms herself, a "working" amateur; if we had not, we would have seen it from her account of the two days' work dividing the Munstead Primroses. It is practical, yet idyllic, and, like many other idylls, has behind it something prosaic. In this case it is—the midges.

Those who write about flowers will learn much from the "Colours of Flowers," although we may be pardoned for saying that it is

FIG. 102.—FREE CLUSTER-ROSE AS STANDARD IN A COTTAGE GARDEN.

spring-like profusion when all else is on the verge of death and decay gives an impression of satisfying refreshment that is hardly to be equalled throughout the year." While we could extract many passages of similar tone, it is not to be taken for granted that they form the whole of the teaching of the chapters on the months. They abound with "practical and critical" notes of culture, arrangement, and colours of many plants, spoken of in the most helpful way.

The chapter on "Large and Small Gardens" is one which gives many useful hints, not only to those who are about to form or improve a garden, but to others as well. Here is a little bit with which it begins: "The size of a garden has very little to do with its merit. It is merely an accident relating to the circumstances of its owner. It is the size of his heart and brain and goodwill that will make his garden either delightful or dull, as the case may be." Pleasant pictures of gardens are given in appreciative words, and a few graphic sentences give the contrast afforded by what is aptly termed "monstrous gardens." The beauty of an "orchard garden" is spoken of, and a touching page or so about the window-box of a factory lad reveals, unconsciously to the authoress, that innate kindness of heart which some of us have experienced.

"Beginning and Learning" is enjoyable to those who have passed the initial difficulties of gardening. Our "learning" is never done,

exceedingly difficult to express these as we would like. We have asked people working all their lives among ribbons and other coloured "fabrics" to name the colour of a certain flower and have found them at a loss. Only those living among flowers and trees could have written the delightful passages on the "Scents of the Garden." It reminds us of a walk in Dublin Trinity College Gardens with their talented curator, Mr. F. W. Burbidge, and the revelations had, not only of the perfumes to be discovered as the plants are passed by, but of those which, like the uses of adversity, are only known when the leaf is bruised.

The "Worship of False Gods," "Novelty and Variety," and the "Bedding Fashion," show Miss Jekyll in her most critical vein. Emphatic as are the criticisms, through them can be seen that element of toleration already alluded to. Is it the subject of "Commissions" to which Miss Jekyll refers as a "great evil that calls loudly for redress?" Lovers of "Geraniums" will be grateful to the authoress for the kindly way in which she speaks of the plant, which has been made so common and degraded by its use as a trim bedding plant, that it is overlooked when plants are wanted for plans for which the bright flowers of the scarlet or pink "Geraniums" come in so well.

Perhaps no part of "Wood and Garden" will give rise to so much difference of opinion as that on "Masters and Men." It is difficult to

find the *via media* in the matter. At times the master expects too much from the man. Then the man, who has the greater technical knowledge of the art, but whose acquaintance with plants and gardens may be less—one says it advisedly—than that of his master, may be so rooted to old ways that he cannot carry out the wishes of his employer. He is a wise man who tries to enter as far as he can into his master's plans. By his willing acquiescence he has a better opportunity of bringing to bear upon the plans of work that practical and technical skill he has acquired. But some gardeners appear to think the garden is theirs and not that of their master. Employers, too, sometimes misunderstand their men, and think that what is really a love for their plants is a dislike to interference. We knew a gardener whose employer was actually afraid to cut flowers in the garden while he was in it. But the master would have forgiven it had he seen and heard the pitiful way in which the gardener produced a pot in which he had grown a *Coleus*. The employer had come in and cut the plant off close by the surface of the soil. The old gardener was moved almost to tears as he showed me the remains of his cherished plant. The good employer is, like the good gardener, "born not made."

A notice of "Wood and Garden" cannot conclude without saying that the book is admirably printed on good paper and is well bound. It is fully illustrated with excellent photographs by the authoress. One of these is here reproduced by the courtesy of the publishers. The Dean of Rochester, on page 234 of his charming book referred to last week, says: "Miss Jekvill has given to horticultural literature the most perfect example of practical wisdom in combination with poetical thought"—a happy summary, and the work will be certain to find its way into many garden libraries.

DEATH OF MR. PETER DRUMMOND.

WITHIN a fortnight of his having attended the funeral of his late employer Mr. James Kelway, the founder of the Langport Nurseries, Mr. Drummond, who had been foreman at the nurseries for twenty-six years, very suddenly passed away on Monday evening, June 5th, while engaged in his business. It appears that about 7.30 he sold a customer some plants, and after packing them some little time later, he carried the box to the entrance and put it into a trap. While doing this he appeared well, and was observed to be as chatty as ever, but the moment he had deposited the box in the trap he dropped upon one knee, and instantaneously expired. His elder son, Mr. H. D. Drummond, happened to be on the premises at the time, and was at once summoned, but found his father quite dead, although he had seen him alive and well a few minutes previously.

Mr. Drummond, who attained his sixty-sixth year last August, has been a nursery foreman ever since he reached manhood, excepting only that for a time prior to his coming to Langport he rented a nursery at Yeovil. He was a remarkable man in his business—to use a homely phrase, he was "good all round." It was his especial delight to have an appointment with anyone who took an interest in any of the branches of floriculture, and walk round the extensive span of glass houses at the nurseries, displaying and expatiating upon the specialities he had under his own personal care. How proud he was when he could show an especially fine *Cineraria* or *Begonia*, and he would draw one's attention to the peculiar markings of a *Petunia* and *Gladiolus*, and gloat over the big *Pæonies*, with their varied shades, and the houses hanging thickly with well-shaped *Cucumbers* as long as a man's arm. How tenderly he handled all his nurselings, just as a loving mother would handle her babe; and, meanwhile, he would vary his descriptions of flowers and plants by the interpolation of some shrewd observation on current topics.

If ever a man loved his occupation Mr. Drummond was that man. His whole mind was full of his work, and he seldom, if ever, forgot the simplest detail, even—a fact that showed the vitality within him—up to within a short period of his death, getting up in the night to see that the heating apparatus in the exotic and propagating houses were going on all right: in fact it may truly be said, in every branch of his delightful occupation, he emulated his late employer in enthusiasm. Mr. Drummond leaves a widow, to whom his unexpected death has been a severe shock: two sons, whom he has trained to follow his own business, and three daughters. In him the widow and children have lost a loving husband and parent, the firm a painstaking and trustworthy foreman, and the workmen under his charge a kind and considerate overseer. It may be added that by the latter, however humble their position, he was esteemed as a "good friend," and whenever he found young men with inquiring minds and anxious for information regarding their business, he was never backward in imparting it. It is supposed death was the result of apoplexy, induced by the remarkable heat. There being no doubt but that death arose from natural causes, an inquest was not deemed necessary.—("The Western Gazette.")

To this Messrs. Kelway & Son add: "We need hardly say that, respected and warmly appreciated as he was by us, and associated so closely as he has been since 1873 with the improvement of plants of which he was so fond, and over which he was ever most remarkably enthusiastic, Mr. Drummond's death has been a severely felt loss to us. We mourn a man of forceful intellect and inventive mind, a most clever cultivator, a charming personality, a devoted friend, and most faithful servant."

ROSE SHOW FIXTURES IN 1899.

- JUNE 21st (Wednesday).—Isle of Wight (Shanklin).
 „ 24th (Saturday).—Windsor.
 „ 27th (Tuesday).—Westminster (R.H.S.) and Southampton.
 „ 28th (Wednesday).—Bath, Croydon, Maidstone, Richmond, and Ryde.
 „ 29th (Thursday).—Canterbury, Eltham, and Sutton.
 JULY 1st (Saturday).—Crystal Palace (N.R.S.).
 „ 4th (Tuesday).—Gloucester and Harrow.
 „ 5th (Wednesday).—Brockham, Ealing, Hanley, Hitchin, Reigate (Redhill), and Tunbridge Wells.
 „ 6th (Thursday).—Co'chester (N.R.S.) and Farningham.
 „ 7th (Friday).—Hereford.
 „ 8th (Saturday).—Manchester.
 „ 11th (Tuesday).—Reading and Wolverhampton.†
 „ 13th (Thursday).—Bedale, Brentwood, Helensburgh, Norwich, and Woodbridge.
 „ 14th (Friday).—Ulverston.
 „ 15th (Saturday).—New Brighton.
 „ 19th (Wednesday).—Cardiff.
 „ 20th (Thursday).—Salterhebble and Sidcup.
 „ 22nd (Saturday).—Newton Mearns.
 „ 25th (Tuesday).—Tibshelf.

* Shows lasting two days. † Shows lasting three days.

—EDWARD MAWLEY, *Rosebank, Berkhamsted, Herts.*

HEREFORD ROSE SOCIETY

THE exhibition that is annually held in the Shire Hall, Hereford, under the auspices of the Hereford and West of England Rose Society, has been fixed for Friday, July 7th, when it is hoped there will be an excellent display. The schedule that has been forwarded to us by the Hon. Assistant Secretary, Mr. Thomas Carver, High Town, Hereford, comprises twenty-six classes, amongst which are some open to nurserymen, others to amateurs, and still more to Herefordshire growers only. The chief nurserymen's class is for seventy-two varieties, with three prizes of a total value of £12, while for any amateurs there is a class for twenty-four varieties with £4, £2, and £1 as the prizes. In the Herefordshire section a gold medal and £1 are offered for eighteen varieties, with £2 and £1 as the second and third awards. There are also classes for herbaceous flowers and decorative exhibits. All particulars may be had from Mr. Carver, at the address given above.

IVY AS A TIMBER SPOILER.

THERE is no doubt that a venerable old forest tree clothed with Ivy is a fascinating sight, and one of those pictures which some people grow excited over. The old tree has lost its youthful vigour, many of its branches are dead, and the few that remain have a sickly appearance. The Ivy alone looks vigorous, and by its tenacity holds the tree in a perpendicular position. And so it ought to do, considering that it is the parasite which has robbed the tree of its life blood, and by its clinging propensities has brought about its decay. It is really surprising how many hundreds of fine forest trees are now undergoing the process of being done to death by the Ivy which clings to their trunks, and yet no effort is being made to rescue them. There is a spice of sentiment about it, of course, and there is something pretty about a self-planted Ivy fixing itself at the foot of a forest giant, and sending out its tiny tendrils, which grip with infant grasp the stem of the tree.

It may not be noticed at first, or no regard is taken of it, but little by little, year by year, the Ivy ascends higher and higher, till at length it entirely encircles the bole, wreaths itself among the branches, and the tree becomes like a swimmer in the clutches of an octopus.

Why is Ivy allowed to ramble over and entirely ruin so many fine timber trees? Carelessness is one reason, and another is because Ivy is pretty, no matter where it grows, and for the sake of appearances people are loth to cut it away. The idea is obviously wrong. We have none too many forest trees in garden and woodland that we can afford to sacrifice them to the worship of Ivy, and though the latter is charming on wall or ground, I would allow it no quarter on trees. Surely a specimen forest tree is handsome enough in itself without further adornment, particularly if the adorning material is to be the means of bringing about its decay. The moral is obvious, and for the sake of timber trees keep the Ivy in its proper place. Put sentiment entirely aside, take hatchet and saw and boldly cut through the Ivy stems as close to the ground as possible. There will doubtless be an unsightly look about the tree for a time, and the withering of the green will be followed by the rustle of dead brown leaves; but it will be only for a time.—V. T. W.

ROYAL HORTICULTURAL SOCIETY.

DRILL HALL.—JUNE 13TH.

THE Show at the Drill Hall on Tuesday was in every respect an excellent one, for not only was the display well diversified, but also of excellent quality. All sections were represented. Mr. Beckett's collection of vegetables attracting equal attention with any other exhibit in the Hall.

FRUIT COMMITTEE.—Present: P. Crowley, Esq. (in the chair); with Messrs. G. Banyard, E. Shaw Blaker, W. Poupart, J. H. Veitch, A. H. Pearson, A. Dean, S. Mortimer, W. Bates, G. Wythes, H. Balderson, J. Smith, and G. Norman.

There was only one collection of vegetables staged for the Sherwood cup, which is to be regretted, though it is doubtful whether a better collection has been staged before in the month of June than the one exhibited by Mr. E. Beckett, gardener to Lord Aldenham, Elstree, Herts, who arranged fifty-three distinct varieties of vegetables in a tasteful and attractive manner. The varieties were—Victoria Rhubarb, Veitch's Perfect Gem Lettuce, in excellent condition; Royal Osborne Cucumber, beautiful fruits; Dell's Crimson Beet, Ellam's Early Cabbage, some excellent Snowdrop Potatoes; Sutton's Magnum Bonum Cauliflower, a group of beautiful heads; Sutton's Dessert Tomatoes, Carter's Trailing White Marrows, typical fruits; Carter's Jumbo Lettuce, large hearts, in prime condition; Express Foreign Radish, Sutton's Sunbeam Tomato, a good even dish; some really fine Scarlet Perfection Carrots, Mushrooms, Magnum Bonum French Beans, Grosse Parresseuse Lettuce, a large Cabbage variety; Veitch's Golden Jubilee Tomato, large, well coloured fruits; Early White Milan Turnips, Long Forcing Carrots, Carter's Model Cabbage, a capital mound; Thomas Laxton Peas, Pen-y-byd Marrows, six pretty fruits in excellent condition; Giant Tripoli Onions, Beckett's Victory Cucumber, Carter's Leviathan Broad Beans, Globe Artichokes in two varieties; Sharpe's Victor Potatoes, a splendid dish; Giant Red Onions, Carter's Duke of York Tomatoes, beautifully ripe; Heartwell Cabbage, Ne Plus Ultra French Beans, Colossal Asparagus, Prince Albert Vegetable Marrows, a green variety; Early Milan Turnip, Brown Cos Lettuce, Mona's Pride Potatoes, Sutton's Peachblow Tomato, looking very distinct here; Carter's Defiance Cauliflower, Ideal Cucumbers, Golden Nugget Tomatoes, Hicks' Hardy White Lettuce, Carter's Early Morn Peas, Carter's Crimson Ball Beet, Spinach The Carter, Canadian Wonder French Beans, Moore's Cream Marrows, Sutton's Early Gem, Cutbush's Polegate Tomato, Veitch's No. 7 Cabbage, Windsor Castle Potato, some monstrous Leeks, Holborn Model, and Carter's Delicatesse Radish.

Mr. Miller, gardener to Lord Foley, Esher, staged nine Melons. The varieties were the old well-known Wm. Tillery and Archie Henderson. Mr. S. Mortimer, Rowledge, also staged a group of Melons Hero of Lockinge.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); with Messrs. H. M. Arderne, S. A. de Graaff, C. T. Drury, H. B. May, R. Dean, W. Howe, J. Jennings, J. Hudson, C. J. Salter, J. D. Pawle, W. Bain, C. Jeffries, J. Walker, G. Gordon, C. E. Shea, J. W. Barr, E. T. Cook, H. J. Cutbush, E. Beckett, H. Turner, C. Blick, E. H. Jenkins, G. Paul, H. J. Jones, H. S. Leonard, E. Mawley, and J. Fraser.

Messrs. Barr & Sons, Covent Garden, arranged an extensive display of hardy flowers. The Irises formed one of the chief features, and consisted of varieties of the pallida section, such as Astarte, Celeste, Princess Beatrice, and Walmer. In the L. neglecta section the best were Victorine, Madame Chereau, Virgine, and Miss Maggie, while the squalens type was represented by Dr. Bernice, Jacquinianna, and Salar Jung. In the variegata section Darius, Gracehus, and aurea, a rich chrome yellow. Ixias in variety, and Heuchera sanguinea were notable in the collection, as were also the Pæonies, Oriental Poppies, Aquilegias, and Pyrethrums.

Messrs. H. Cannell & Sons, Swanley, staged an admirable group of Cannas, arranged with Palms, Ferns, and Asparagus. They were mostly grown in 5-inch pots, and presented a bright appearance. Paul Lorenz, Roi des Rouges, Beaute Poitevine, Czar Alexander III., Ami Pichon, Provincial, President McKinley, and Duke of Marlborough were the pick of the crimson shades; while in the spotted and edged varieties were equally conspicuous, Queen Charlotte, Comte de Bouchand, Florence Vaughan, Admiral Avellan, Madame Pichon, and Duchess of York; while Ami J. Chrétien, Aurea, and Burbank were also good.

Messrs. G. Cooling & Sons, Bath, staged two boxes of their new garden Rose Purity, a charming flower, pure white, slightly pink in the centre, of good shape, and very floriferous, will be prominent as a garden Rose; also Cooling's Yellow Noisette, a yellow, of good shape and colour. The Tottenham firm of T. S. Ware, Ltd., presented a fine display of hardy flowers, comprising a rich collection, which contained many noteworthy plants. Liliun rubellum was in good form; Irises Madame Patti, Schiller, maerantha, Celeste, and Bridesmaid; Hieracium villosum was conspicuous, as were also the bunches of Pinks, Pyrethrums, Armerias, Poppies, and Delphiniums.

Mr. Maurice Pritchard, Christchurch, Hants, exhibited herbaceous plants in excellent style; the whole collection was remarkable for its freshness. The chief features were some excellent double Pyrethrums, such as Solfaterre, Florentina, Perfection, J. N. Twerdy, and La Vestale; Iris hispanica Beauty of Haarlem, a good white form, and Leander, a golden yellow. The bearded forms were well represented. A beautiful bunch of Orchis maculata, Mudeford variety, attracted much attention, as did O. foliosa. The pretty little Daisy, Bellis cœrulescens, with its heliotrope flowers, contrasted favourably with the gorgeous Poppies, Liliuns Gaillardias, and Pæonies.

Mr. Chas. Blick, gardener to Martin Smith, Esq., Hayes Common, staged a semicircular group of Carnations arranged with a background of Palms, and nicely edged with Ferns. The flowers were large, and the foliage all that could be desired. Mrs. Martin Smith, a grand silvery pink Malmaison, formed one of the chief varieties, while other noteworthy sorts were King Oscar, Calypso, Horace Hutchinson, Mrs. Trelawney, Mercia, Thora, Florizel, and Grace.

Messrs. F. Sander & Co., St. Albans, staged a table of new plants, chief of which were Canna Sander's Variegated, Caladium Countess of Warwick, Goodia elegans, a pretty decorative plant; Kentia Sanderiana, and Pandanus Sanderi; also two baskets of Carnation Lily Measures, with a fine plant of Acalypha Sanderiana in full beauty, also Cyperus fertilis, a quaint species, and Arcea Ilsemanni. Messrs. J. Carter & Co., High Holborn, staged a group of Gloxinias, which were bright, well flowered, and very varied, the spotted varieties being particularly good. The same firm also exhibited six bowls of Lily of the Valley grown from retarded crowns.

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, presented a large collection of Irises, consisting of the germanica, pallida, neglecta, and hispanica sections. Some of the best varieties and species were I. pallida Albert Victor, a beautiful variety; I. p. dalmatica and delicata. In the germanica section Garrick, Faust, Louis Van Houtte, Madame Chereau, Hector, and Queen of May were the best. The Oriental Iris, with its deep blue flowers, with some varieties of the Spanish type, contributed to the display, while a collection of Ixias, Anemones, and Ranunculuses completed the display.

Messrs. R. Wallace & Co., Colchester, also staged a good collection of hardy flowers. The Liliuns were deserving of notice first, L. excelsum, L. rubellum, L. Thunbergianum in variety, L. longiflorum giganteum, and several of the umbellatum type were staged. The Iris siberica in variety, also some of the germanica and pallida types, were well arranged. The Calochorti were interesting and in great variety; Brodiaeas, such as Howelli, lilacina, capitata, Hendersonii, and ixioides were pretty, and a few specimens of Incarvillea Delavayi proved of much interest to the general public.

Mr. H. B. May, Dyson's Lane Nurseries, Edmonton, had a fine collection of hardy Ferns, including some nice specimens of Athyrium f.-f. furcillatum, purpurascens, Victoria, Veronia plumosum, elegans cristata, plumosum superbum, with some interesting Scolopendriums, Polystichums, Lastreas, Adiantums, and Blechnums, the whole edged with Ficus repens.

Messrs. Paul & Son, Cheshunt, staged a fine collection of Rhododendrons, Roses and hardy flowers, also some baskets of rock plants; these included some interesting plants, such as Viola palustris, Allium echenphrazum sibericum, Armerias, and Geraniums. The Rhododendrons comprised some beautiful forms, such as Princess, Mrs. R. S. Holford, H. W. Sargeant, Mrs. Hankey and Stella. The Roses were of the garden type, such as Carmine Pillar in fine form, Marquis of Salisbury, Double Pink Scottish, Blarii No. 2, and some of the hybrid Briars.

Messrs. G. Jackman & Son, Woking sent a collection of hardy flowers, also a number of single Roses and hybrid Briars. The Pyrethrums were bright and a good colour; the Oriental Poppies, Irises in variety, Pinks, Campanulas and Iceland Poppies, all contributed their share to the display. The Clematis coccinea hybrids were deserving of attention, while the Penzance Briars were much admired. The best were Lady Penzance, Meg Merrilees, Amy Robsart, Lord Penzance, and Julia Mannering.

A pleasing group of Ivies, chiefly of the arborea type, was sent by Mr. John Russell, Richmond, comprising many distinct kinds. H. helix arborea aurea, Silver Queen, palmata aurea, and aurea spectabilis were distinct and pretty. Mr. F. Cant, Colechester, exhibited a collection of garden Roses which were much admired. The Crimson China and the old common China are not to be despised as staged. Bardou Job, Papillon, Marquis of Salisbury, Reine Olga de Wurtemberg, Camoens, Gustav Regis, and Madame Chedane Guinoisseau were noteworthy, while the Austrian and Scotch Roses were excellent. The collection claimed a large amount of attention, showing that these garden varieties are likely to be as popular as the exhibition forms.

Mr. B. Ladham, Shirley Nurseries, Southampton, staged a collection of hardy flowers, in which the Pinks, Pyrethrums, and Irises were to the fore. The Pinks Diamond, Lizzie Dewar, and Caroline were good. The new Lupinus arboreus albus Snow Queen was distinct. The Heuchera sanguinea and Gaillardias were bright and showy. Messrs. Jas. Veitch & Sons, Ltd., presented a box of their hybrid Java Rhododendrons in excellent condition, the flowers were larger than usual, and the colours very attractive. Mr. Chas. Turner, Slough, staged a box of Carnations, including such varieties as Goldylocks, Rizzio, Edith, Lady Bristol, Galileo, Benbow, The Emir, and Chieftain.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); with Messrs. J. O'Brien, H. Dixon, de Barri Crawshay, H. Little, J. T. Gabriel, A. H. Smea, F. Sander, H. J. Chapman, A. Outram, E. Ashworth, T. W. Bond, J. Colman, J. G. Fowler, F. Mason, S. Courtland, H. T. Pitt, W. H. Young, and T. B. Haywood.

Cattleyas were most numerous in the group of Orchids contributed by Messrs. H. Low & Co., Bush Hill Park, Enfield. The plants were all well grown, and carried flowers of fine size, substance, and colour. There were also included a few examples of Odontoglossum crispum. The Cattleyas represented varieties of Mossiae and Mendeli. Mr. W. H. Young, Orchid grower to Sir Frederic Wigan, Bart., East Sheen, sent a most effective group of Orchids. Not only was there excellence in the quality of the plants, but also in the arrangement. Lælia purpurata,

Cattleya Mossiae, *Odontoglossum vexillarium* memoria J. D. Owen, O. v. Empress, *Victoria Augusta*, crispum in variety; *Cypripediums* W. H. Young, *Cymatodes*, and *Gertrude Hollington*, with *Cattleya Warneri*, *Bifrenaria vitellina*, and others were most conspicuous.

Mr. H. Whiffen, gardener to J. Bradshaw, Esq., The Grange, Southgate, exhibited a small but very effective group of Orchids, all the plants showing capital culture. The examples of *Odontoglossum crispum*, *Cattleyas Mossiae* Mrs. Egerton Grey, Mrs. J. Bradshaw, and alba, with *Lycaste Deppii*, *Odontoglossum eittosum* and *Pescatorei* were perhaps the most attractive. Messrs Stanley Mobbs & Ashton, Southgate, arranged a bright group of Orchids, including *Marmodes pardinum*, *Odontoglossum crispum* in variety, *Miltania vexillaria* in variety, and several others.

Messrs. F. Sander & Co., St. Albans, staged *Laelio-Cattleya Ingrami* superba; Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Woodford, *Cattleya Mossiae Victoria*, C. M. Glebelands variety, C. Mendeli J. Gurney Fowler, C. Eldorado splendens, and others; Messrs. J. Veitch and Sons, *Laelio-Cattleya Lucilia*, L. C. Eudora alba, and *Epidendrum langleyense*; and Mr. H. T. Pitt, Stamford Hill, *Cattleya Forbesi*, *Lælia tenebrosa Pittiana*, and *Promæa citrina*, Rosslyn variety. Mr. S. Cooke, gardener to de Barri Crawshay, Esq., Sevenoaks, staged an attractive group of *Odontoglossums*, including *O. crispum* Princess May (a superb variety), *coradinei* Crawshayanum, *O. crispum* White Emperor, and others.

The most charming group of Orchids in the Hall was undoubtedly that from Messrs. J. Veitch & Sons, Chelsea, who showed in splendid form. Amongst the most attractive flowers were *Lælia purpurata* Russelliana, L. purpurata, *Brassia verrucosa*, *Disa Veitchii*, *Angræcum modestum*, *Anguloa Ruckeri*, *Laelio-Cattleya Eudora*, *Cattleya Forbesi*, *Dendrobium snavissimum*, *Odontoglossum crispum*, *Epidendrum elegantulum* luteum, *Cœlogyne Dayana*, *Cymbidium Lowianum*, *Dendrobium Dearei*, *Cattleya Warneri*, *Oncidium divaricatum*, *O. macranthum*, *O. crispum*, *Sobralia Keinastiana*, *Odontoglossum cordatum*, *Cochlidia Noezliana*, *Spathoglottis anreo-Veillardii*, *Phalænopsis Ludde-vioacea*, P. John Seden, and *Trichoplia marginata*.

Amongst the very numerous growers of Orchids who contributed small exhibits were Mr. H. Ridden, gardener to G. W. Bird, Esq., West Wickham, who staged *Odontoglossum Andersonianum* Mrs. G. Bird, *O. crispum* Margaret Bird, and *O. c. Catherine Bird*; Mr. T. Rochford, Broxbourne, who staged *Odontoglossum Adriane* Rochfordianum; Mr. R. B. Leech, Dulwich, who sent *Epidendrum Wallisi*; Mr. R. G. Fletcher, Withdean, Brighton, who contributed *Odontoglossum crispum* Brighton Beauty and *O. c. Flore de Fletcher*; Mr. G. Day, gardener to H. F. Simonds, Esq., Beckenham, showed *Lælia purpurata* Simondsii; Messrs. J. MacBean & Co., Cooksbridge, *Cattleya Mendeli* Protheroeana; and Mr. H. Holbrook, gardener to E. Ashworth, Esq., Wilmslow, *Odontoglossum Adriane* Ashworthianum.

MEDALS.—Fruit Committee: Silver Banksian medal to Mr. S. Mortimer, and bronze Banksian medal to Mr. J. Miller. Floral Committee: Silver-gilt Flora medals to Messrs. F. Cant & Co., H. Cannell & Sons, and C. Blick; silver Flora medals to Messrs. T. S. Ware, Ltd., J. Russell, and H. B. May; silver Banksian medals to Messrs. J. Veitch & Sons, Paul and Son, R. Wallace & Co., M. Prichard, Barr & Sons, and F. Sander; bronze Banksian medal to Messrs. G. Jackman & Son. Orchid Committee: Gold medal to Messrs. J. Veitch & Sons, Ltd.; silver-gilt Flora medal to Mr. W. H. Young; silver Banksian medals to Messrs. H. Low and Co., Stanley Mobbs & Ashton, H. Whiffen, and de Barri Crawshay.

CERTIFICATES AND AWARDS OF MERIT.

Carnation Don Carlos (C. Blick).—One of the best yellow grounds we have seen. The colouring is bright rose (award of merit).

Carnation Lady Rose (C. Blick).—A superb rose coloured variety. The petals are of great size and the flower is very fragrant (award of merit).

Carnation Florizel (C. Blick).—This variety has size and substance of petal. The colour is very bright cerise. The variety is faintly clove scented, but inclined to split the calyx (award of merit).

Carnation Goldfinch (C. Turner).—This variety has a perfect petal. The colour is yellow (award of merit).

Carnation Agnes Sorrel (C. Turner).—A clove scented dark crimson variety of great size (award of merit).

Carnation Flack (C. Turner).—A splendid variety. The colour is yellow, with a peculiar red suffusion (award of merit).

Carnation Ossian (C. Turner).—A good Fancy. The ground is chrome yellow, with light and dark red markings (award of merit).

Carnation Galatea (C. Turner).—A finely formed yellow ground. The marginal colour is bright scarlet (award of merit).

Carnation Galileo (C. Turner).—A superb dark variety. The pale yellow ground colour is almost obscured by the crimson (award of merit).

Cattleya Eldorado Glebelands variety (J. Davis).—A richly coloured variety. The sepals and petals are intense rose purple. The fimbriated lip is maroon, and the throat deep yellow (award of merit).

Cattleya Mossiae Victoria (J. Davis).—This is a chastely beautiful variety. The sepals and petals are delicate rose, the latter being very broad. The handsome lip is white at the deeply fimbriated margin, with a flush of rose in the centre and yellow veined crimson in the throat (award of merit).

Cattleya Mendeli albescens (W. H. Young).—A very beautiful variety, pure white in colour save for the yellow throat (award of merit).

Epidendrum langleyense (J. Veitch & Sons).—This is a hybrid from a cross between *E. pseudopendulum* and *E. Wallisi*. The narrow stout sepals and petals are deep yellow, as also is the broad flat lip, which has crimson spots and shadings in the centre (award of merit).

Laelio-Cattleya Lucilia (J. Veitch & Sons).—This higenerie hybrid came from a cross between *Cattleya Dowiana* and *Lælia elegans*, and both parents may be seen. The sepals and petals are white with purple featherings at the tips. The lip is maroon on the front lobe, with white deepening to lemon and yellow in the throat (award of merit).

Lupinus arboreus albus Snow Queen (B. Ladlams).—This is a decided advance on the well-known type (award of merit).

Odontoglossum Adriane Ashworthianum (H. Holbrook).—A marvellously spotted variety. The white ground is almost wholly obscured by the brown blotches and spots (first-class certificate).

Odontoglossum coradinei Crawshayanum (de Barri Crawshay).—A finely marked variety. The yellow of the ground has large brown blotches and spots over the whole surface (award of merit).

Rhododendron Essex Scarlet (Paul & Son).—A variety of merit. The colour is rich crimson with black spots on the upper segments (award of merit).

Rose Purity (G. Cooling & Sons).—A variety of considerable value that received the gold medal of the National Rose Society in 1898 (award of merit).

Rose Yellow Noisette (Cooling & Sons).—A peculiarly fragrant Rose of soft yellow colour (award of merit).

NOTES ON ALPINE FLOWERS.

(Continued from page 283.)

CAMPANULA PLANIFLORA.

THOSE who are interested in the Campanulas will join with me in thanking the Rev. C. Wolley-Dod for his interesting note on page 294 regarding *C. planiflora*. Few have the long experience and wide knowledge he has of the Campanulas, so that his remarks are of much value. It would perhaps help us in the matter if he could give us the earliest reference he can find to the reputed habitat of the plant. If, as we are told, "botanical writers, from an early date in last century to this day, have followed one another in saying that it was found in the neighbourhood of Hudson's Bay," some one of these must have been almost, if not contemporaneous, with the date of the so-called introduction.

What is of more importance is Mr. Wolley-Dod's experience of its relation to *C. persicifolia*. Did the plants he purchased as *C. planiflora* (nitida) flower and appear to be the same as that before they passed into their *persicifolia* stage? Is it not possible that the supposed seedling from *C. persicifolia*, which has the characters of *C. planiflora*, may be from the latter? There is a strong presumption in favour of Mr. Wolley-Dod's view, that the forms of *C. planiflora* are stunted forms or hybrids of *C. persicifolia*. At the same time I have not before heard of them developing into *C. persicifolia*.

TOLMIEA MENZIESII.

The colour of this rather singular plant is sometimes described in catalogues as "terra-cotta." One has little difficulty in saying that this is rather misleading. "Greenish" is the adjective used by one work of reference, but perhaps the words green and brown express it better. Because of its ineffective colouring and its rather coarse habit it cannot be recommended for the alpine garden. It grows from 1 to 2 feet high. It is interesting from being a plant which reproduces itself very rapidly by means of small plantlets formed at the base of the radical leaves. The latter eventually rest on the soil, and the plantlets project their roots so as to enter the earth. By this means the *Tolmiea* soon covers a considerable space of ground. It comes from North-West America, and is quite hardy. At one time known as *Heuchera Menziesii*, or as *Tiarella Menziesii*, it was removed from these genera, and now forms a monotypic genus. It blooms in April and May. It may be grown in shade and in a light soil.

ANEMONE NEMOROSA VARIETIES.

It may be seasonable to direct the attention of some readers to a few of the more beautiful of the forms of our common Wood Anemone, which makes so beautiful many of our woods in spring. One would place among the first of these the double form, known as *A. nemorosa* fl.-pl., whose full flowers are highly appreciated. The double form known as *A. n. rosea* fl.-pl. is very beautiful with its rosy hued and white blooms. Very quaint looking is *A. nemorosa bracteata*, whose flowers are popularly known as those of the "Jack-in-the-green" Anemone, with their green bracts surrounding the pretty white blooms. There is also a very large flowered white form, which passes under various names. The coloured forms are exceedingly beautiful.

In some districts the Wood Anemone is more or less tinted with blue, and one of better colour than usual has been named *A. n. cœrulea*. This is very pretty, and worth growing. Another, still finer, is commonly known as *A. n. Robinsoniana*, or *A. n. cœruleseas*. It is of the highest type of beauty among the varieties of the species. *A. n. purpurea* is deeper and warmer than *A. n. cœrulea*, and *A. n. Alleni* is rather larger than *A. Robinsoniana*, with a shade of mauve in its colouring. *A. n. Vestal* has white anthers and petals. One cannot do better than imitate the conditions under which this Windflower is found in Nature. It likes partial shade and moisture, although in rockwork it will thrive with less of either than in the border. The varieties may be propagated by division of the tubers.

ARABIS ALPINA, FL.-PL.

For so many years has *Arabis alpina* been grown that it is remarkable that it has not before now given us more variety. What has for some time been wished for has at last occurred, and there is now in existence

a double form. It was shown at the Royal Horticultural Society's meeting on April 18th, 1899, and will, doubtless, be distributed by the trade in due time. Its principal advantages ought to be a better colour, and its lasting longer in flower, unless heavy rains lodging among the petals discolour these. It is to be hoped that it may prove as free-flowering as the type.—ALPINUS.

(To be continued.)

PLANTING VEGETABLES.

WHEN is the best time to plant the various kitchen garden crops that, from time to time, require removal from the seed beds to the quarters where they are expected to remain for permanent use? This is a question that has several times been asked, and is one to which anything but a general answer can be given; for, although it is customary to say "plant out after rain," the many failures we see from so doing would seem to imply that the advice must be acted upon with caution, or, in other words, it must be qualified to suit the circumstances of the case. We have all seen fine young stocks of Lettuces planted out in their final quarters disappear within a very few hours after, and beds of tender annuals have sometimes suffered a like fate, more especially if they be margined by a considerable breadth of grass, which forms a lurking place from which foraging parties of their enemies make nightly sallies, and carry away all that is most valuable. Now, this drawback amounts, in some instances, to the entire loss of a crop, or several crops in succession; nor are protective measures so effective as could be wished; it therefore becomes the inquiring mind to weigh well the benefits of planting after heavy rains, and the evils to which the system is exposed.

I have been so situated as to find it almost impossible to save my Brussels Sprouts and Greens, which it is customary to plant out early in June. I planted them out in wet weather, consequently I adopted the other extreme, and planted them out when the ground, as well as the weather was very dry, and usually with great success. The reason was obvious—a stiff retentive soil is the one most favourable to the production of slugs, the enemies of almost all young and tender vegetation: while a soil of an opposite kind is one of the best antidotes to their increase, the sharp gritty particles of which a sandy soil is composed being at variance with the locomotive powers of slugs, and they are less able to crawl about in search of food, and do not consequently exist in such numbers as in the more adhesive loams, better known in garden phraseology as heavy soils.

Now, as the slug exists in the stiff soil to a more dangerous extent than in the dry sandy one, we may reasonably infer that the planting operation ought to be done on the stiff soil in dry weather, in order that the plants may escape the ravages they would be subjected to were they planted out whilst it was wet, and apparently favourable to the plants growing well. A few dull days in the midst of dry weather are to be preferred, and to such plants as those of the large Cabbage family, which root rather deeply, there is seldom that lack of moisture in such soils as to render more than one watering necessary, while on dry, sandy, or gravelly soils of some districts they would want that assistance almost daily, in order to support themselves against the drying influence by which they are surrounded.

In planting out crops on these two soils it is easy to see that two different courses must be adopted—the stiff retentive one must be planted in dull weather, and when the surface of the ground is tolerably dry; while the sandy or gravelly soil must be planted, if possible, in a showery season, in order that the plants may derive the full benefit of that agent, on which they must look as affording them the most important portion of their daily food—*i.e.* atmospheric moisture. These reasons being given, it is easy to see when the best time has arrived for planting out the various Cabbageworts in summer.

It is next a matter of inquiry as to their size, and other particulars, and this is, also, tolerably easy to define; for a small, delicate plant, with its leafstalks elongated, so as to be unable to support the broad portion of its leaf, is not at all likely to withstand the sunshine of midsummer, or the drying effects of the dog days; but such a plant may be able to endure the change which is rendered comparatively easy, when performed at a time when both the ground and the atmosphere is saturated with moisture. It then speedily accommodates itself to the altered circumstances of its position, and those leaves, which, at planting out, were unable to hold up their proper side to the sun, quickly recover strength to do so, and that before any serious harm takes place from their reversed position, for the latter was done while the sun had comparatively little chance to injure them, the air being moist. Let it be observed that this operation must only be performed on ground that is tolerably free from such pests as prey on the young plants, otherwise its delicate condition, when in the state we have thus described, will speedily tempt them to its destruction. There is a class of plants less robust than the Cabbageworts, and equally, if not more, agreeable to the stomach of the voracious slugs; these must be differently treated, for they cannot well endure the scorching sunshine that the others can, neither are they so deep rooted as to penetrate below its influence; with these, therefore, some more stringent means must be adopted to drive out or keep at bay those enemies that are so likely to suffer from.

Usually repeated workings of the soil will effect that purpose; but when that has not been accomplished the addition of something or other as a repellant to them; for this, nothing is better than soot or wood ashes, which besides are excellent manures; but, in addition to their use, the ground must be made very fine, and, if it be very dry, it ought not to be

planted immediately after being watered; but after the top has got a little dry again, and when the plants are put in, and, if needs be, watered, take the precaution to scatter some dry ashes or other offensive substance over the ground to repel the invasion of the enemy. By this means it is likely the plants will get hold enough with the moisture which there exists to withstand the more trying part of the season without having recourse to the watering pot, which too often invites the depredators.

As much of the after success of a plant depends on its deriving all the advantages it can at planting time, and consequently avoiding all the evils, it becomes a matter of importance to select the most fitting time on which to perform these various operations; and not only that, but to watch them sedulously afterwards for some time. It is worse than useless to say that everything depends on the watering pot, for be assured that water, especially hard, injudiciously applied, is quite as likely to do harm as it is good.—N. J.

GOOSEBERRY CLUSTER-CUP FUNGUS.

ECIDIUM GROSSULARIE.

THIS parasite has been known to infest the Gooseberry, and in less degree the Red Currant since 1829, but how long anterior to that time it was recognised by botanists I do not know. Up to the year 1868 and 1869 the parasite was seldom heard of, still it occasionally occurred, and in some seasons was disastrous to the crop in a few localities. Since that period the fungus has been more recurrent and widespread, hence a few remarks respecting it may be useful.

The illustration, fig. 110, shows the fungus as it appeared under the microscope in the form of swollen patches on the leaves and fruit, received

FIG. 110.—ORANGE FUNGUS ON GOOSEBERRY.

References.—A, spur in fruit (natural size), showing: a, spots on under side of leaves; b, fruit infested on side; c, berry attacked at heel; d, the same infested at nose. B, cluster-cups, enlarged 10 diameters. C, a cluster-cup magnified 30 times. D, section through peridium, enlarged 50 diameters. E, spores, magnified 260 times; e, spore germinating.

by the Editor from the county of Meath, in Ireland. It usually infests the Gooseberry during April, May, and June first, so far as I have observed, on the leaves, but sometimes both leaves and fruit simultaneously. On the leaves it occurs on the under side, represented in A at a natural size. The affected parts at first have a pale green colour, then yellow, and finally orange-red. The patches on the leaves are about $\frac{1}{4}$ inch across, considerably raised on the under side and correspondingly depressed on the upper surface of the leaf. On the fruit the fungus gives rise to swollen patches, and may infest it at the side b, the heel c, and nose d.

On the affected parts are numerous cluster-cups, shown enlarged ten diameters at B, and one magnified thirty times at C. Each cluster-cup, or peridium, has the sides formed of a single layer of cells, the hollow containing several erect branches springing from the mycelium, each consisting of chestnut brown rounded cells or spores, which are liberated by the mouth of the cup, shown, enlarged fifty diameters, at D. The spores, however, vary greatly in form through compression in the cup, some, enlarged 260 diameters, being shown at E, and one germinating, e.

The fungus renders the fruit unfit for use, and when the leaves are much infested greatly weakens the bushes. The affected fruit, therefore, should be promptly removed and burned, and the bushes sprayed with a solution of potassium sulphide, 1 oz. to 3 gallons of water, directing the spray upwards so as to reach the cluster cups on the under side of the leaves.

As a preventive the bushes should be sprayed in spring with the sulphide of potash solution at least once before the expanding of the leaves, at the strength just quoted, then before flowering with a solution at a strength of 1 oz. to 10 gallons of water, in this case spraying

upwards; then repeat again as soon as the fruit has fairly set, and not exceeding a strength of 1 oz. to 6 gallons of water if wet weather prevail, or if dry the strength before named, 1 oz. to 10 gallons of water. This treatment usually suffices, but in certain seasons it may be necessary to repeat the dressing. Mr. Graham's method of prevention was given on page 459, June 1st.—G. ABBEY.

NOTES ON PINES.

THOUGH Pines are not so largely grown as was once the case I am sending a few brief seasonable notes that may be of service to some readers of the Journal. I am not without hopes that they may regain a measure of popularity, as it cannot be disputed that well-grown fruits produced at home are infinitely superior to those that are sent us from abroad.

Fruit Ripening.—Though syringing the plants must cease when the fruit commences to colour, the supply of water at the roots should be continued as before when necessary, and to improve the quality and colour of the fruit ventilate liberally, but do not allow the temperature to fall below 80° in the daytime, gradually diminishing the moisture in the house, and maintaining a night temperature of 70° to 75°. Plants of Queens, Enville, and Providence started last February will ripen their fruit this month, whilst Smooth-leaved Cayenne and Charlotte Rothschild will require about a month longer to finish properly. Under the same conditions they furnish a successional supply of fruit, which may be still further extended by removing some of the fruiting plants to a cool airy place after the fruit is sufficiently advanced in ripening. The bottom heat should be maintained at 80° to 90°, those being the extreme points, but the more regular the heat at the roots the better.

Successional Plants.—The weather is not yet such as to safely dispense with artificial heat, but fires will not be required much longer, as the sun heat, by the assistance obtained from the heated beds in which the plants are plunged, rarely allows the atmospheric temperature to fall below 65°, which is more suitable for the satisfactory development of the plants than a higher temperature from fire heat. As recently potted plants make growth quickly, strict attention should be given to ventilation to prevent an attenuated growth, therefore admit air at 75° to 80°, increasing it until 85° is reached, and above that ventilate fully, diminishing in the afternoon, closing the house at a temperature of 80°. Afford a light sprinkling daily in the afternoon when bright weather prevails.

Starting Suckers.—From those on the early fruiting plants a sufficient number should be selected to meet the demand, and if started at once, the plants will be suitable for fruiting from this time onwards another season, and prove supplementary to those started in March, their requirements being identical, only shading must be more effectual.—G. A. H.

SALADS AND FRUITS.

FROM an article on "Cool Food for Hot Weather," in the *Daily News* we cite the following paragraphs:

"A spell of unusually hot weather makes a change in diet imperative if we are to adapt ourselves to the demands made upon us by heightened temperature. Nature is liberal in providing us with cooling and laxative foods at this season, if we are not too wedded to convention to try them. Make salads of everything that will lend itself to salad-making, but keep the Lettuce before you as a *pièce de résistance* at all times. The more succulent Lettuce we eat in hot weather, the better for our physical comfort. Some object to uncooked vegetables of any kind, much as they like salads generally. Let these people eat cold cooked Asparagus and Beans in salad form, as long as both are to be procured.

"*Apropos* of salads, a special mention should be made of those composed of fruit; this is a delicious mode of serving ripe fruit, and a mode by which we secure the full flavour and medicinal virtues thereof, which are sometimes lost or changed by cooking. The dressing of a fruit salad will, for the gourmet, be one of sweet wine with a soupçon of fine liqueurs, but ordinary people will be quite content with the juice obtained by stewing and straining a portion of other fruits with sugar, or cream may take the place of the fruit juice. A variety of fruits make a pleasanter salad than one kind alone, though when Strawberries are in question mixing these with another fruit is not to be allowed. One of the most delicious salads is that commonly met with in Parisian restaurants—and only rarely seen elsewhere—namely, the wild Strawberries of the woods, dressed with claret. Our own 'small scarlets' may make a fair imitation of this, but they have not the delicate aroma of the wild berry. Following on Strawberries, ripe Currants, mixed with Raspberries, make another good combination, and shced Apricots, with stoned Morello Cherries, still another.

"A diet largely composed of fruit, vegetables, and milk will keep the blood cooler and the system better nourished than any number of so-called cooling drinks, or other preparations. One of the greatest mistakes we can make in hot weather is to partake of ices, iced dishes, or iced drinks. Though the immediate effect felt after swallowing these may be one of coolness and refreshment, yet this quickly gives place to one of increased heat, and often induces an almost parched feeling in the mouth. Follow Nature as closely as possible, and her guidance will invariably bring about the best results.

"In addition to cooling properties, Nature's remedies provide just those phosphates and tonics that the physical man craves most in summer heats. Potash salts, magnesia, lime, and iron—all these are largely present in all the vegetables and fruits, but more especially in some, and for all

these a great demand is daily created. In Spinach we have iron in a very marked degree, also in all the red and black fruits—to wit, Red and Black Currants, Raspberries and Blackberries. Those who suffer from poverty of blood would do well to make Black Currants their standard fruit. In Cabbage, Peas, green Gooseberries, and Green Gages we have more phosphates and lime than iron; abundant nourishment of a light and easily digested kind we have in Mushrooms, Beans, and well cooked Potatoes. From Tomatoes, Marrows, Cucumbers, Melons, and all lush fruits we gain water that largely does away with the necessity for much drink; where free use is made of these thirst will never be felt to any great degree. It is false economy that spares the money that fruit and fresh vegetables cost; better far would it be to spend money this way than in drink of any kind."

WEST HALL, BYFLEET.

THIS very interesting and pretty estate, the residence of F. C. Stoop, Esq., lies on the right hand side of the road leading from Byfleet Station to the village of that name, and is about midway between Weybridge and Woking. The gardener, Mr. G. Carpenter, who has been in this situation about five years, was, oddly enough, some nine years in the employ of Major C. Browne, who has the adjoining estate, so that he seems closely attached to the locality.

During his stay at West Hall Mr. Carpenter has, in conjunction with Mr. Stoop's liberal expenditure, effected great improvements, amongst others being a clean sweep of the old glass houses, and the erection in their place by Messrs. Burton & Sons of a good range of lean-to's as vineries, and three long span plant, Peach, Melon, and Tomato houses, comprising several compartments. Then there has been an entire replanting of the walls with fruit trees, wiring of garden walks, and planting these with espaliers, general opening and improving of the pleasure grounds, and many other capital alterations, so that the place is greatly changed, whilst every year now helps to effect material developments.

Though the place is flat, it is both well timbered and watered. Rhododendrons are there a truly grand feature; many of these seem as though planted a century since, for in various directions such masses have they become that arched walks have been formed beneath them, and the wood growth is dense as a thicket. A short avenue of Cedrus deodara in front of the house shows some truly noble specimens, such as are rarely seen; whilst on the roadside there are Wellingtonias in quantity, such as can be rarely equalled anywhere in the kingdom.

THE GLASS HOUSES.

The vinery range is 110 feet long by 15 feet wide. There are three compartments, the centre, and earliest forced being the largest. This is planted with Black Hamburgh Vines chiefly, a few Buckland Sweetwater and Foster's Seedling completing. These Vines have been nearly three years planted, and are carrying excellent crops, many bunches having been already cut. A few pot Vines assist as supernumeraries to furnish fruit on the uncropped spaces. In one end house Madresfield Court, Gros Colman, Gros Maroc, Lady Downe's, and Black Alicante all doing remarkably well, and in the other end Muscat of Alexandria Vines also carrying a good crop, and capital bunches furnish the house. It is noticeable that very free lateral and especially top growth is allowed to all the Vines, the object being to excite active root action. Of course with comparatively young Vines there is yet ample room for such free growth.

There is a fine span Peach house, 90 feet by 15 feet. It is planted with eight permanent trees on each side, but there are a few supernumeraries at present. All these are in excellent condition, full of wood and clean leafage, yet not of excessive growth, whilst in almost every case there are good fruit crops. The arrangement of the varieties answers admirably to produce a long succession without starting portions in compartments, for there are none. Peaches comprise Waterloo, all gathered; Hale's Early, just ripe, and one of the very best of the earliest; Royal George, Barrington, Violette Hâtive, Walburton Admirable, and Princess of Wales. Nectarines are Rivers' Early, Précoce des Crouels, Lord Napier, Humboldt, Pine Apple, Stanwick Elrige, and Victoria. There have been numerous trees in pots fruited also.

PLANTS.

The other houses are in compartments, in which are seen in one case a good collection of Orchids, in another table and room plants, in a third fine foliage and various stove plants, in a fourth greenhouse plants, including, as may also be seen in the conservatory, numerous Canterbury Bells, both white and rose coloured, grown here for a long succession in great numbers in pots, and very beautiful they are so treated. In one house Eucharis amazonica planted out in enclosed brick beds does finely, blooming profusely. Another division is devoted to Melons and Cucumbers, and yet a farther one to Tomatoes. These are planted on narrow raised turf beds on each side, and are trained up under the glass roof; all are in capital condition. The earliest supply of fruit has been obtained from pot plants. These are just getting over as the others are carrying ripe fruits. The principal variety is Polegate.

In all the plant houses climbers form telling features. Stephanotis, Allamanda Hendersoni, Dipladenia amabilis, Gloriosa superba, Clerodendron Balfourianum, Passiflora princeps, and one of the loveliest of all, carrying small but great numbers of trusses of pretty yellow flowers, Stigmaphyllon ciliatum. Very recently the Night-blooming Cereus was a striking and attractive feature, flowering in one house. There is a nice conservatory adjoining the mansion, that is kept full of flowers.

and is luxuriantly draped with climbers. The pleasure grounds are not extensive, but are admirably kept, and include some pretty semi-aquatic aspects beneath the overhanging trees.

CHRYSANTHEMUMS.

Although not now an exhibitor of these flowers, Mr. Carpenter was a successful one not very long since. But like the most ardent exhibitors, he grows a big collection of plants, and not content with having named varieties, has raised not a few fine seedlings. Seed is obtained by careful fertilisation, employing only the very best, cutting over the petals to such a convenient depth that when the stigmas are fully developed they project just above the severed florets, and are in that way fertilised with pollen taken from other flowers. In this way a fine stock of plants has been raised, and all the selected ones are being again grown this season, that they may be fully tested before being offered in commerce. Where there are from six to ten plants of a seedling variety thus grown, it is evident that a sounder idea can be obtained as to the real merits of a variety than is possible when the seedling plant only is flowered. Were more care taken in this respect fewer failures would result.

It need hardly be said that a look over these seedlings at West Hall when in bloom next November should be of a very interesting nature. They will be none the less of interest because from seed saved on the place and not obtained by purchase. Were many growers to follow Mr. Carpenter's example, seedling varieties, now plentiful, would become thick as leaves on Vailambrosa. No doubt ample opportunities will be furnished for a look at them in due course.

KITCHEN GARDEN.

By some solid brick projections, which stand out fully 12 feet from the main walls across the borders, the chief walls are broken into sections, and these, on the south aspect, are planted with Peaches, Nectarines, and Apricots respectively, the trees being about three years established. All are doing admirably, and seem to appreciate the wind-breaks thus produced. On other walls Pears and Plums are similarly planted. Running right across the garden, from north to south, are two 7 feet wide walks; each of these is covered with wired trellis some 8 feet wide at base and 7 feet in height. One walk is planted with twenty-eight Apple trees, 14 feet apart, the other with Pears, all horizontal trained, and now some 8 to 9 feet across. These should in time make admirable garden features. The walks are midway bisected by another broad one, that is planted on each side throughout with some three or four rows of Carnations, and both run at the extreme end into a fine broad walk, flanked with hardy perennials, of which there is a first-rate collection.

Bush fruits and Strawberries are well grown, with excellent promise on all. The Black Currant mite is kept well down by careful picking over in the winter. Vegetables are plentiful and good. The soil is a semi-sandy loam, characteristic of the county of Surrey, in which, however, everything seems to thrive very well. A pleasing feature beneath some pollarded Filbert trees is a mass of Aquilegias, many of which, including the charming hybrids, are abundant. The general state of the gardens is excellent.—A. D.

ROYAL NATIONAL TULIP SOCIETY.

NORTHERN SECTION.

ALTHOUGH the vagaries of the alleged spring had wrought sad havoc and devastation amongst the Tulips of many unfortunate growers, there was a surprisingly good display of specimens of this favourite May flower exhibited at the Coal Exchange, Manchester, on Friday, June 2nd last.

The Rev. F. D. Horner took premier honours with fine, well grown, attractive specimens, yet his competitors were left but little in the rear; indeed, we do not remember to have seen flowers of better quality exhibited for many years. In Class 1, which is rather an exacting one to satisfy, all the four stands were of great merit, any one of them being quite worthy of a first prize.

Breeder Tulips were rather scarce, though several beautiful examples were on view. Amongst the named flowers Samuel Barlow was very prominent, blooms of Sir Joseph Paxton were not so numerous, Annie McGregor was hardly in as good form as usual. The flamed byblomems were rather a weak class. Of feathered Tulips there were several good examples in Trip to Stockport, Annie McGregor, Sulphur Bessie, and George Hayward put in one of his rare appearances.

The room in which the Tulips were exhibited was a very convenient and excellent one for the purpose, tastefully decorated with foliage plants kindly lent by Mr. Bentley, the Society's indefatigable Secretary. Though the day proved a very enjoyable one to the lovers of the flower, the attendance of the public was not so numerous as one reads of at a football match.

Class 1. *Twelve dissimilar Tulips, two feathered and two flamed in each class.*—First, Rev. F. D. Horner, Burton-in-Lonsdale, with Samuel Barlow and Paxton, flamed, Masterpiece and Paxton, feathered bizarres; Talisman and Adonis, flamed, Lady Harcourt and Camp's Seedling, feathered byblomems; Annie McGregor and Mabel, flamed, A. McGregor and Mrs. Atkin, feathered roses. Second, Mr. J. W. Bentley, Kersal, with Paxton and S. Barlow, flamed, Paxton and Sulphur, feathered bizarres; Talisman and Universe, flamed, Foster's Seedling and Bessie, feathered byblomems; A. McGregor and Mabel, flamed, Mrs. Collier and Mrs. Atkin, feathered roses. The Samuel Barlow in this stand was awarded the premier prize for the best flamed Tulip in the whole exhibition. Third, Mr. C. W. Needham, Royton, with Samuel Barlow and Wm. Lee, flamed, Attraction and Wm. Annibal, feathered bizarres; Adonis and Elizabeth Pegg, flamed, Trip to Stockport and Elizabeth Pegg, feathered byblomems; Aglaia and Mabel, flamed, Mrs. Atkin

and Mabel, feathered roses. The premier prize for the best feathered Tulip was awarded to the specimen called Trip to Stockport exhibited in the above stand. Fourth, Mr. A. Moorhouse, Wakefield, with Paxton and Hepworth's Seedling, flamed, Masterpiece and Paxton, feathered bizarres; May Queen and Bridesmaid, flamed, Bertha and Trip to Stockport, feathered byblomems; A. McGregor and Mrs. Bright, flamed, Modesty and Miss Nightingale, feathered roses.

Class 2. *Six Tulips, one feathered and one flamed of each class.*—First, Rev. F. D. Horner with Paxton, and Masterpiece feathered; Adonis and a seedling feathered; Annie McGregor, flamed and feathered. Second, Mr. Needham with Wm. Lee, and Masterpiece feathered; Elizabeth Pegg, and Trip to Stockport feathered; Mabel, and Mrs. Collier feathered. Third, Mr. Bentley with Paxton, and Rifleman feathered; Talisman, and Mrs. Cooper feathered; A. McGregor, and Modesty feathered. Fourth, Mr. Moorhouse with Dr. Hardy, and Masterpiece feathered; Talisman, and Bessie feathered; A. McGregor, and Modesty feathered. Fifth, Mr. Wm. Mellor, Wakefield, Paxton, feathered; and flamed Mrs. Jackson and G. Hardwick, A. McGregor and S. Headley. Sixth, Mr. J. H. Wood, Middleton, Paxton, and a seedling feathered; Talisman and Alice Grey, Mabel and Modesty. Seventh, Mr. Dymock, Stockport, King and Masterpiece, Adonis and Bessie, Mrs. Moores, and a seedling feathered.

Class 3. *For 10s. 6d. subscribers only.*—First, Mr. G. Eyres, Ripley, with Dr. Hardy, and Lord Lilford feathered; Mabel, and Count feathered; Jeanette, and Adonis feathered. Second, Mr. W. Prescott, Bedford Leigh, Paxton and Lilford, A. McGregor and Seedling Talisman, and Violet Amiable.

Class 4. *Three feathered Tulips.*—First, Mr. Bentley with Lord Stanley, Bessie, and Alice. Second, Mr. Moorhouse with Paxton, Bertha, and Alice. Third, Mr. Needham with Albert, Trip to Stockport, and Modesty. Fourth, Mr. Buckley, Paxton, Trip to Stockport, and Modesty. Fifth, Mr. Woods, Paxton, Bessie, Modesty. Sixth, Mr. Mellor, G. Hayward, J. Henry, Modesty.

Class 5. *Three flamed Tulips.*—First, Rev. F. D. Horner, Paxton, A. McGregor, and a Talisman-like seedling. Second, Mr. Needham, S. Barlow, Aglaia, Mrs. Jackson. Third, Mr. Mellor, Paxton, A. McGregor, and Mrs. Jackson. Fourth, Mr. Moorhouse, Paxton, A. McGregor, and Talisman. Fifth, Mr. Wood, Paxton, A. McGregor, and Talisman. Sixth, Mr. Bentley, Paxton, Denman, and A. McGregor.

Class 6. *For maiden growers only, one feathered and one flamed Tulip.*—First, Mr. G. Eyres, Ripley, with Paxton, and Heroine feathered. Second, Mr. T. Buckley, Staleybridge, Paxton, and Masterpiece feathered. Third, Mr. Mallinson, Middleton, Paxton and Modesty.

Class 7. *One feathered and one flamed Tulip.*—First, Samuel Barlow memorial prize, Mr. C. W. Needham with Lord Stanley, and Bertha feathered. Second, Rev. F. D. Horner, Dr. Hardy and Modesty. Third, Mr. Eyres, Paxton and Heroine. Fourth, Mr. Dymock, A. McGregor and P. Hart. Fifth, Mr. Wood, Paxton and Heroine. Sixth, Mr. Bentley, Dr. Hardy, and Paxton feathered.

Class 8. *Single Blooms.*—

Feathered Bizarres.

- 1 Rev. F. D. Horner with Paxton
- 2 Mr. Moorhouse with Masterpiece
- 3 Mr. Moorhouse with John Ratcliffe
- 4 Mr. Moorhouse with Wm. Annibal
- 5 Mr. Bentley with Lord Stanley
- 6 Mr. Needham with Albert
- 7 Mr. Bentley with Devonshire
- 8 Mr. Bentley with Hy. Lowe
- 9 Mr. Bentley with Lord F. Cavendish
- 10 Mr. Eyres with Lord Lilford

Feathered Roses.

- 1 Mr. Bentley with Count
- 2 Mr. Bentley with Count
- 3 Rev. F. D. Horner with Industry
- 4 Mr. Bentley with Jane
- 5 Rev. F. D. Horner with S. Headley
- 6 Mr. Bentley with Modesty
- 7 Mr. Bentley with Julia Farnese
- 8 Mr. Prescott with Aglaia
- 9 Mr. Bentley with Alice
- 10 Mr. Bentley with Arlette

Feathered Byblomems.

- 1 Mr. Moorhouse with Bessie
- 2 Mr. Moorhouse with Bessie
- 3 Mr. Moorhouse with Trip to Stockport
- 4 Mr. Needham with Adonis
- 5 Mr. Needham with Talisman
- 6, 7, 8, and 10, Mr. Bentley
- 9 Mr. Moorhouse

Flamed Bizarres.

- 1 Rev. F. D. Horner with Samuel Barlow
- 2 Rev. F. D. Horner with Paxton
- 3 Mr. Needham with Dr. Hardy
- 4 Mr. Moorhouse with Samuel Barlow
- 5 Mr. Bentley with Prince of Wales
- 6 Rev. F. D. Horner with Ajax
- 7 Rev. F. D. Horner with Orion
- 8 Mr. Bentley with San José
- 9 Mr. Needham with Wm. Lee
- 10 Mr. Needham with Lord Stanley

Flamed Roses.

- 1 Mr. Eyre with A. McGregor
- 2 Rev. F. D. Horner with Mabel
- 3 Rev. F. D. Horner with Aglaia
- 4 Rev. F. D. Horner with A. McGregor
- 5 Mr. Bentley with Tryphena
- 6 Mr. Mellor with Madame St. Arnaud
- 7 Mr. Bentley with Triomphe Royale
- 8 Mr. Prescott with Seedling
- 9 Mr. Prescott with Mrs. Collier
- 10 Mr. Wood with Sarah Headley

Flamed Byblomems.

- 1 Rev. F. D. Horner with Mrs. Cooper
- 2 Rev. F. D. Horner with Sutherland
- 3 Mr. Dymock with Universe
- 4 Mr. Bentley with Chancellor
- 5 Mr. Horner with Talisman
- 6 Mr. Needham with Adonis
- 7 Mr. Bentley with Seedling
- 8 Mr. Bentley with Litchurch
- 9 Mr. Bentley with Denman
- 10 Mr. Eyres with Mrs. Jackson

Class 10. *Six dissimilar breeder Tulips, two of each class.*—First, Rev. F. D. Horner with R. Yates and Paxton, Mrs. Barlow and a seedling rose, two seedling byblomems. Second, Mr. Bentley, Goldfinder and Lloyd's 47, Adonis and Litchurch, Rose Hill and Mrs. Barlow. Third, Mr. Moorhouse with Goldfinder and Paxton, Talisman and Bridesmaid, Rose Hill and Mrs. Barlow. Fourth, Mr. Wood with Excelsior and Paxton, Wm. Parkinson and Alice Grey, Rose Hill and A. McGregor. Fifth, Mr. Needham with R. Yates and Goldfinder, Adonis and Seedling, Rose Hill and A. McGregor. Sixth, Mr. W. Mellor, Wm. Lee and J. Goodhouse, Talisman and Elizabeth Pegg, A. McGregor and Industry.

Class 11. *Three breeder Tulips.*—First, Rev. F. D. Horner, Paxton, A. McGregor and a seedling. Second, Mr. Needham, Samuel Barlow, Mrs. Barlow and Bridesmaid. Third, Mr. Mellor, Paxton, Mrs. Barlow and seedling. Fourth, Mr. Moorhouse, Paxton, Talisman and Annie McGregor.

Fifth, Mr. Bentley, Lloyd's 47, Rose Hill, Leech's No. 1. Sixth, Mr. Dymock. Seventh, Mr. Prescott. Eighth, Mr. Eyres.

Class 12. *Single blooms. Breeders.*
Bizarre Breeders.

- 1 Mr. Bentley with Lloyd's 47
- 2 Mr. Moorhouse with Wm. Wilson
- 3 Mr. Needham with Samuel Barlow
- 4 G. Eyre with Sulphur
- 5 Rev. F. D. Horner with Seedling
- 6 Rev. F. D. Horner with Storer's "3 A"
- 7 Rev. F. D. Horner with Paxton
- 8 Mr. Bentley with Lloyd's Seedling

Rose Breeders.

- 1 Rev. F. D. Horner with A. McGregor
- 2 Rev. F. D. Horner with Mad. St. Arnaud
- 3 Rev. F. D. Horner with Mrs. Barlow
- 4 Rev. F. D. Horner with Rosy Morn
- 5 Mr. Bentley with Rose Hill
- 6 Mr. Bentley with Mabel
- 7 Mr. Bentley with Loveliness (a Darwin)
- 8 Mr. Mellor with Geo. Hardwick

Byblumen Breeders.

- 1, 2, 3, and 4 Rev. F. D. Horner with Seedlings
- 5 Mr. Bentley with Agnes
- 6 Mr. Bentley with W. Parkinson
- 7 Mr. Eyres with Lizzie
- 8 Mr. Mellor with Talisman.

The Best Breeder Tulip.—Lloyd's 47 Seedling, shown by Mr. Bentley in his stand.

The seedlings exhibited by the Rev. F. D. Horner were all of his own raising and of the finest and purest quality.

SOUTHERN SECTION.

The following are the details of the exhibition, held under the auspices of the Royal Botanic Society, Regent's Park, May 17th, which we were unable to obtain earlier.

The premier prize, a silver cup specially designed by Mr. H. G. Moon, and presented by Messrs. Barr & Sons, bulb growers, of King Street, Covent Garden, and Long Ditton, Surrey (open to all amateurs and gentlemen's gardeners, losing stands may compete in classes A and F, *eighteen dissimilar Tulips, two feathered, two flamed, and two breeder Tulips of each class*) was awarded to Mr. J. W. Bentley, Kersal, Manchester, who exhibited Clio and Annie McGregor flamed, Julia Farnese and Mabel feathered, Rose Hill and A. McGregor breeder roses; Excelsior and San José flamed, General Grant and Masterpiece feathered, Excelsior and Goldfinder breeder bizzarres; Chancellor and Othello flamed, Ashmole's 126 and Adonis feathered, Adonis and William Parkinson breeder roses.

Class A. *Twelve dissimilar rectified Tulips, two feathered and two flamed in each class.*—First, Mr. A. D. Hall, Wye, Ashford, with Samuel Barlow and Paxton flamed, Lord F. Cavendish and Paxton feathered bizzarres; Annie McGregor and Aglaia flamed, S. Headley and Count feathered roses; Geo. Edward and Adonis flamed, Trip to Stockport and Proserpine feathered byblomens. Second, Mr. C. W. Needham, Ryton, with Samuel Barlow and Paxton flamed, Masterpiece and Paxton feathered bizzarres; A. McGregor and Aglaia flamed, Clio and Miss Edwards feathered roses; Sutherland and Talisman flamed, Talisman and Bessie feathered byblomens. Third, Mr. A. Chater, Cambridge, with Paxton and Dr. Hutcheon flamed, Richard Headley and Paxton feathered bizzarres; S. Headley and Aglaia flamed, Modesty and S. Headley feathered roses; Mrs. Jackson and Sutherland flamed, Black Prince and Guido feathered byblomens.

Class B. *Six dissimilar rectified Tulips, one feathered and one flamed in each class.*—First, Mr. Bentley, San José, and Masterpiece feathered bizzarres; Trip to Stockport, feathered and flamed byblomens; and Mabel, and Julia Farnese feathered roses. Second, Mr. Hall, Samuel Barlow, and Attraction feathered bizzarres; Sutherland, and Adonis feathered byblomens; Aglaia, and S. Headley feathered roses. Third, Mr. Needham, Paxton, and Masterpiece feathered bizzarres; Sutherland, and Adonis feathered byblomens; Aglaia, and Mabel feathered roses. Fourth, Mr. Chater, Dr. Hutcheon, and Masterpiece feathered bizzarres; Mrs. Jackson, and Black Prince feathered byblomens; Aglaia, and S. Headley feathered roses.

Class C. No exhibit.

Class D. *Three feathered Tulips, one of each class.*—First, Mr. Bentley, Masterpiece, Guido, and Modesty. Second, Mr. Chater, Masterpiece, Adonis, and Modesty.

Class E. *Three flamed Tulips, one of each class.*—First, Mr. Hall, Dr. Hardy, Talisman, and Aglaia. Second, Mr. Bentley, Lord Stanley, Trip to Stockport, and Aglaia. Third, Mr. Needham, Samuel Barlow, Talisman, and A. McGregor. Fourth, Mr. Chater, Dr. Hutcheon, Sutherland, and Aglaia. Fifth, Mr. G. Edom, Walton-on-Hill, Masterpiece, Ashmole's 126, and Aglaia.

Class F. *Six dissimilar breeder Tulips, two of each class.*—First, Mr. Hall, with Goldfinder and Wm. Lea bizzarres; Lady Grosvenor and A. McGregor, roses; Talisman and Adonis, byblomens. Second, Mr. Needham, with Goldfinder and W. Lea, A. McGregor and Mabel, Elizabeth Pegg and Ashmole's 112. Third, Mr. Chater, with Paxton and Goldfinder, Modesty and A. McGregor, Agnes and Headley's 42.

Class G. *Three dissimilar breeder Tulips, one of each class.*—First, Mr. Hall, with John Heap, Orleans, and A. McGregor. Second, Mr. Bentley, with Ashmole's 126, Queen of England, and Goldfinder. Third, Mr. Edom, with Masterpiece, Mrs. Hardy, and Queen of England. Fourth, Mr. Needham, with Goldfinder, Mabel, and Talisman. Fifth, Mr. Chater, with Lord Lilford, Mrs. Barlow, and Maid of the Mill.

Best feathered Tulip.—Mr. Chater, with R. Headley.

Best flamed Tulip.—Mr. Hall, with Geo. Edward.

Best breeder Tulip.—Mr. Hall, with Adonis.

Class H. *The "Samuel Barlow" prizes for the best pair of rectified Tulips; one feathered and one flamed of any class.*—First, Mr. Needham with Samuel Barlow and Modesty. Second, Mr. Bentley with Lord Stanley and Julia Farnese. Third, Mr. Hall with Paxton and S. Headley. Fourth, Mr. Chater with Dr. Hutcheon and Miss Nightingale.

For a Collection of May flowering decorative Tulips, Darwins, and others.—The silver medal of the Royal Botanic Society was awarded to Messrs. Barr and Sons, King Street, Covent Garden.

The gold medal of the Royal National Tulip Society was awarded to Messrs. Barr & Sons for their display of English Florist Tulips of all classes.—C. W. N.

THE YOUNG GARDENERS' DOMAIN.

THE BOUVARDIA.

JUDGING from the specimens that one sometimes sees it might be supposed that Bouvardias were difficult to cultivate; such, however, is not the case, and good bushy plants may be easily grown if the few simple requirements are understood and carefully attended to. Let us start with old plants that have bloomed and have been allowed a period of rest. These must be cut back, and be placed in the intermediate house or stove, and syringed daily, to encourage growth. If they are to be retained they must be repotted as soon as they have started into growth, reducing the old ball, and placing them in pots just large enough to allow of a little fresh soil being placed round; put the plants in a moist warm house, and syringe every day.

If large specimens are not required it is preferable to raise fresh plants each year, as these can be rapidly grown to serviceable size, and will produce blooms of better quality more freely than old ones. Cuttings should therefore be taken when the growths are about 2 inches in length, inserting them round the sides of clean well-drained 4-inch pots filled with a light open compost. When the cuttings are in place apply water, and stand the pots in a close propagating case, keeping moist and shaded. When well rooted afford as light a position as possible, but shade from bright sun until they become hard. At the first opportunity transfer them to 3-inch pots, in a compost of loam, leaf soil, peat, and sand in equal parts, replacing in a moist warm house.

With renewed root action pinching to the first pair of leaves must be done, and lateral growths may be stopped at about two joints until sufficiently bushy plants are produced; they should not, however, be stopped later than the first week in July. As the plants increase in size, and the pots become full of roots, they must go to the flowering sizes, 5 or 6 inches being large enough, according to the strength of the plants. Employ a compost of two parts of fibrous loam, one part each of leaf soil, peat, and sand, adding a little well-decayed manure. Let the pots be well drained, and when the work is finished return to the intermediate house, giving abundance of water, and syringing daily to prevent attacks from red spider or green fly.

When well established in the flowering pots weak liquid manure can be applied once a week. Towards the end of July remove the plants to a cool house or frame, and when hardened afford plenty of air, so that the growths may be well matured. Before the advent of frost remove them to a house where they can have the benefit of a little heat should the weather be cold and wet. At intervals of two or three weeks place a few plants into heat, so as to obtain a succession of these useful flowers during the winter months.—S. P.

CELERY CULTURE.

THE seeds for the main crop of Celery should be sown not later than the middle of February, though for later plants a few seeds may be sown a month after. If new the seeds germinate quickly in light soil slightly covered, and the pans or boxes plunged in bottom heat. When the seedlings have made their second leaf they should be pricked off about 2 inches asunder in boxes, if no frames or hotbed material is available, and be kept in a light position, and be gradually hardened until the plants are quite strong.

Do not let the plants crowd each other, but prepare some more frames, preferably with a hard bottom, such as are used for standing pot plants in. Place in about 3 inches of decayed manure, and over this 3 inches of soil; transfer the plants, 4 inches apart, to these frames from the boxes, shade and admit air carefully for a few days after being planted, but when growth is seen to advance give abundance, and by the middle or end of May, if the weather is warm, the lights are best off. Some give much warmer treatment than I am advocating, and get plants ready to put out in the trenches by the third week in May, but little is gained by the method.

The trenches should be 15 inches deep, and not less than 4 feet asunder. Place a good quantity of decomposed manure at the bottom of each, and cover with 3 inches of soil. Put out 9 inches apart, with good balls of soil and roots, when the plants are quite ready. The ridges between the trenches will grow excellent crops of Lettuce if prepared early enough. If the weather is hot and dry liberal quantities of water will be required to keep them growing freely.

When the plants are about 1 foot high clear them of side growths, and tie loosely to prevent the outer leaves being broken; in about three weeks retie the plants higher up, and add a few inches of soil round them. Give liquid manure if possible weekly, and earth the plants fortnightly until finished, always being careful to keep the soil out of the crowns. If worms or other insects are troublesome use plenty of burnt garden refuse round the stems, as this will then keep much cleaner. For exhibition purposes brown paper is admirable for blanching the stems; in fact, our leading exhibitors always use it.—FOREMAN N.

FRUIT FORCING.

Cucumbers.—When the night temperature can be kept from falling below 65°, fire heat may be dispensed with. Continue to look over the plants twice a week, well thinning the old growths, and train young in their place. Avoid overcrowding and overcropping, and remove the fruit when fit to cut. Supply liquid manure twice a week, and surface dress with lumpy loam as required. Sprinkle the bed occasionally with sweetened horse droppings, but be careful not to overdo it, or the foliage will suffer irreparable injury. Syringe on clear days in the afternoon only, but keep a good moisture in the house all day by damping the paths, floors, and walls as they become dry. Morning syringing is often the cause of much injury, and if practised at all it should be done early and lightly. Promptly shade on bright weather succeeding a dull period, but at other times only to prevent flagging. Ventilate early, but avoid draughts, and never admit air to lower the temperature. Keep through the day at 75° to 90°, as the force of solar heat dictates; but in bright weather between 80° and 90° should prevail in the house from 8 A.M. to 6 P.M. Close early, so as to increase to 90°–100°, and admit a little air before nightfall as a safeguard against condensed moisture, and increase the ventilation from seven to eight o'clock on sunny mornings.

Pits and Frames.—Unless the weather prove cold night coverings will not be necessary; if put on, it must not be until the sun is off the lights, and it should be withdrawn early in the morning. Commence ventilating at 75°, and increase with the sun's advance, keeping through the day at 80° to 90°, closing at 3 to 4 P.M., then sprinkle the foliage, and after being closed for an hour or two admit a little air at the back of the lights to allow of the pent-up moisture escaping. Water will be required about twice a week, and weak tepid liquid manure may be given occasionally, keeping it from the foliage and fruit. Attend to the plants once a week, stopping the growths about one or two joints beyond the fruit, removing bad leaves and exhausted growths. If the plants show signs of exhaustion top-dress with lumpy loam, and layer some of the younger shoots at a joint from which roots will be freely admitted and strengthen the succeeding growths, so that the plants will continue to produce clean fruit for a long period.

Vines.—*Little Grapes.*—These must be thinned immediately they are large enough, the berries swelling so rapidly at this season that they soon become too large to be thinned properly and expeditiously; besides, when the work is deferred too long the size of the fruit is impaired. The laterals must not be allowed to extend so as to interfere with the principal foliage. The growth may be permitted to extend where there is space to admit of its full exposure to light, but not otherwise, as overcrowding and overcropping are often the causes of failure, and more frequently so than any other error of culture. Remove all superfluous, badly placed, deformed, or small bunches. Crop lightly, which means size, quality, and high finish; bulk signifies small fruit, bad colour, poor quality, often shanking, and always non-keeping. Water thoroughly when necessary, one good watering is worth many dribbles. Afford top-dressings of artificial manures occasionally, and a light mulch of sweet lumpy manure will prove beneficial in most cases by encouraging surface roots and maintaining the moisture uniformly.

Vines Cleared of their Crops.—Syringe the Vines occasionally to keep the foliage clean, afford water to render the soil moist, supply an occasional top-dressing of chemical fertiliser of a phosphatic and potassic rather than a nitrogenous nature, and a light mulching to keep the surface from cracking as well as to prevent the roots going down in search of moisture. Allow a moderate extension of the laterals, but do not permit them to interfere with the principal leaves. Some lateral extension is absolutely necessary to prevent the starting of the main buds and the premature ripening of the foliage. There is no fear of the wood not ripening, the difficulty is in the opposite direction—loss of foliage and starting into growth instead of going to rest in late summer. Ventilate freely when the temperature rises above 60°.

Houses of Ripe Grapes.—Black Grapes will be better for slight shade from powerful sun; some pitchard, or a double thickness of herring nets drawn over the roof-lights, will mostly be sufficient shade, and a good spread of foliage will not injure the berries, but assist Hamburgs keeping colour. Moderate air moisture does not injure the Grapes if accompanied by free ventilation. Keep laterals fairly under, but a little extension will assist in the retention of the principal leaves, and upon their continuance in health depends the maturity of the buds for next year's crop. Muscats and all amber-coloured Grapes improve in colour after being apparently ripe, and bear exposure to light without detriment up to a certain point, that of the rich golden amber stage, but after that they become darker and blotchy; then the skin is very susceptible of moisture and easily spotted, which must be guarded against by free ventilation.

Grapes Ripening.—Afford these a free circulation of air on all favourable occasions, with enough constantly to insure a change of air, as it is a confined stagnant atmosphere that does all the mischief in Grapes "spotting" and cracking. Keep sufficient heat in the pipes to maintain a night temperature of 65°, and 70° to 75° by day, with 80° or 90° through the day from sun heat. Avoid a very dry atmosphere, damping

occasionally, and do not allow the border to become dry. Moderate lateral growth will favour Hamburgs and Madresfield Court, but Muscat of Alexandria colours best when exposed to the light, yet a little lateral growth is desirable as a safeguard against shanking, and for the maintenance of healthy root action.

Grapes Scalding.—Muscat of Alexandria and Lady Downe's are more liable to "scald" than most other varieties, but Hamburgs sometimes suffer severely when completing the stoning process. At that time air should be given abundantly, sufficient warmth being kept in the hot-water pipes to maintain a night temperature of 65° to 70°, and 5° to 10° more artificially in the daytime, leaving a little ventilation on at night, and increase it before the sun acts powerfully upon the house in the morning. This attended to, there will be little, if any, scalding, for it is keeping close, moist, and cold that renders Grapes liable to scald if the weather prove bright.

THE BEE-KEEPER.

WORKING FOR A SURPLUS.

ALL is now activity in the apiary. The hot weather experienced during the past week has had the desired effect on the bees. Stocks that were weak a month ago are now ready for supering, and no time should be lost in providing them with surplus chambers, so that full advantage may be taken of the honey flow which may now be obtained from the numerous flowers in bloom.

The majority of bee-keepers have doubtless already decided in what form they desire to obtain a surplus. If from run honey, then we have no hesitation in recommending, which for want of a better name is termed the doubling system. If comb honey is preferred then 1 lb. sections or shallow frames may be depended on, the former for preference. It is advisable to have supers in various forms. The bulk of honey in the comb, however, should be in sections.

How to obtain the greatest weight of honey from a given number of stocks, and also a small increase in the colonies in the apiary, is the aim of the majority of bee-keepers.

We will endeavour to show how this may be done. Instead of allowing the bees to swarm to obtain an increase, super the strongest stocks, and if they are not overflowing with bees, take some frames of hatching brood from another hive reserved for queen rearing, and give it to the colony intended for honey production. A few notes on work done in our own apiary during the past few days may be beneficial to others similarly situated.

WORK DONE IN THE APIARY.

Only a few stocks are utilised for the production of comb honey. For this purpose we use our largest hives, some of which were formerly treated on the two-queens system, some of them having upwards of eighteen frames. With close attention on the lines advocated in previous notes, we succeeded in filling the majority of them with brood. As such a large brood nest would be a disadvantage if a large surplus from supers were required, we reduced the number of frames to ten. In smaller hives, where the brood nest had been smaller, they were reduced in some instances to eight frames.

The dividing board being placed close to the frames, the open space at the back was filled with spare coverings taken from the tops of the frames. This will prevent the bees from filling it with comb, which they doubtless would, instead of working in sections. A crate of twenty-one sections was at once placed on the top of the frames, with the result that the bees took possession at once. Owing to the brood chamber being restricted a surplus is now being stored. As soon as the more forward sections are partly sealed over another crate of sections will be placed underneath, and as some of the colonies are extra strong in worker bees it may be necessary to give a third crate of sections before any of them are fit for removal. Strong colonies of this description when worked for comb honey require plenty of space in the supers, otherwise there is a liability of them swarming.

The frames of brood that were removed from the above hives were placed in supers on other stocks for extracting purposes, the hives being otherwise strengthened by the addition of brood and bees from other colonies intended for queen rearing, these being placed in the middle of the super and some frames of clean old combs put on the outside, as they are not as liable to break down in the extractor as new combs. Excluder zinc should always be used under frames intended for extracting purposes.—AN ENGLISH BEE-KEEPER.

"FAMILIAR WILD FLOWERS."—Nos. 10 and 11 contain plates of the Wild Strawberry, Furze, common Vetch, Sea Campion, Broad-leaved Plantain, the Green Helibore, Heath or Ling, the Burdock, O.-eye Daisy, Great Mullein, Buxbaum's Speedwell, Flowering Rush, pink Campion, Dog Rose, Spindle Tree, Spotted Orchis, Holly, Privet, Sallow, and clustered Bell Flower.

.. All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," 8, Rose Hill Road, Wandsworth, S.W., and NOT to 12, Mitre Court Chambers, Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor. Letters of inquiry must be accompanied by the names and addresses of the writers, but these will neither be published nor disclosed when initials or *nom de plumes* are given for the purpose of replies.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and it is convenient when each question is written on a separate sheet. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Vines in Pots (Novice).—Stop those for fruiting next season when from 6 to 8 feet long, and pinch the laterals and sub-laterals to one joint as produced. Obtain as much stored-up matter in the Vines as possible by judicious feeding and cleanly foliage, thoroughly exposed to light and air. Vines intended for planting should be kept in comparatively small pots, and in that case they will not make a large amount of lateral growth, which need not be closely pinched, but it is better to stop at first joint, and afterwards not allow the sub-laterals to interfere with the principal foliage.

Pears Filled with Maggots (Anxious).—The Pears are infested by the larvæ of the Pear-gall gnat, *Diplosis pyrivora* or *nigra*. It was described and figured in the *Journal of Horticulture*, June 3rd, 1897, page 487, and preventives and remedies propounded. It is one of the worst diseases to which the Pear is liable, and the pest causing it appears greatly on the increase in some localities. The best things we have used against it: 1, Destroying, by burning, all galled fruit as soon as noticed. This is easily done with bush, pyramid, espalier, and wall trees, but almost impracticable as regards standard trees. We traced the infection of some wall trees to that of the orchard some distance away, and seldom giving anything but blossom, galled fruit, and leaves. Seeing the American recommendation to sow kaint at the middle of June, 7 lbs. per rod, the hint was taken and the practice answered well. As some of the maggots were considered to have dropped out of the galled fruit before this was cleared off the garden trees, the ground about them, quite a yard from the spread of the heads, was similarly treated. We also caught many midges on pieces of tin smeared with a sticky substance and placed in the forks of the branches just before the blossoms unfolded. The gnats also hate smell—that of petroleum or tar water—using before the flowers open. The petroleum should be emulsified, or one part of petroleum emulsion used to seventy parts water, or tar one part to 1000 parts of water, spraying on very lightly.

Doctors Differing (Puzzled).—You need not trouble yourself about "scientific specialists" apparently differing. In the case you mention the difference was one of terms, not of substance. "Ardent young scientists," as an old scientific celebrity not long ago observed, "are always discovering something, especially new names, and there is no keeping pace with them." We may mention another case of difference—one of substance this time. A while ago some minute eggs were sent to us that had been found in the decayed portion of a fruit tree. After examination, the reply was given to the effect, "Not known, possibly the eggs of some small spider." Some of the same eggs were sent to a specialist, who replied they could not, because isolated, be the eggs of a spider. Thereupon some were forwarded to another authority to "settle the difference." The reply was, "eggs of woodlice undoubtedly;" but before this reply arrived the sender of the "specimens" had been quietly engaged in working out the problem for himself, and had obtained a fine brood of young spiders! In cases of doubt it is well to be cautious, but, unfortunately, there are rather too many people in the world so clever that admitting a lack of knowledge would seem to be an operation about as painful to them as the extraction of one of their wisdom teeth. In cases of abstruse questions or of grave doubt, a man is as likely, or more likely, to gain, rather than lose, status, by permitting himself to say—after the manner of the most really eminent—"I don't know."

Fig Leaves and Fruit Rusted (A. B.).—The rust or disease is caused by a minute insect-like creature, *Tarsonymus fici*, which lives to some extent in the cuticular tissues, and by its action there and biting outside gives rise to the rust. It also attacks the fruit, spoiling it, and seriously affects the young wood. Happily it is not of common occurrence, but sometimes proves disastrous, chiefly under glass, and is not infrequently accompanied, or rather followed, by bacteria, which give the leaves a clammy feel. The best means of eradication is frequent syringing with tobacco juice, diluted about twelve times with soft water or nicotine essence, one part in ninety-six parts water, spraying on with an atomiser or pneumatic sprayer, coating with the finest possible film all over, but especially the under side of the leaves. Frequent fumigation with tobacco paper or vaporisation with nicotine also destroy the pest, but we prefer the liquids.

Weevils on Ferns (W. W. W.).—The specimen sent represents the clay or copper-coloured weevil (*Otiorhynchus picipes*). This pest is very injurious to vegetation, feeds at night on a great variety of plants and trees, which should be taken advantage of to capture the pests. Spread, therefore, a white cloth or newspaper on the stage or floor, stand the pot on it, and place some paper on the surface of the pot nearly, but not quite close, to the crown. This should be done in the afternoon, and after dark at night enter the house carefully with a lantern darkened (a bull's-eye one being best with the light turned off); then shake the plant sharply, brushing the fronds with the hand, after which immediately turn on the light and kill all the pests, which will have fallen on the cloth or paper, scrutinising the base of the plant closely where the soil has not been covered. This is the best remedy, repeating until the weevils are annihilated.

Tuberose Flowers not Developing (Anxious).—The tuber is quite sound, also the roots, of which there is no scarcity; stem and leaves are also clean, except for a little "spider." The raceme of flower buds is also strong, but the flowers as they open die off instead of developing. The petals turn brown and wither, and from them appear the outgrowths of the Lily disease fungus in the conidial or *Botrytis* condition. The cause of its appearance we have no means of determining, but it may have been induced by damp. We have found that a little more air—some constantly—had a good effect on the flowers opening, water not being very liberally given, and the feeding, if any, of a phosphatic nature. We have had a similar evil without any accompanying parasite, and attributed the defect to the tubers or bulbs being lifted too early, or taken up and shipped from their American or African quarters before the growth was sufficiently matured and the flowers properly formed in embryo. This we consider the most likely cause of the disaster now appearing, there not being anything apparently defective in the management—indeed the plant, barring the flowers, is as healthy as we have ever seen a Tuberose.

Epacris Culture (G. H. F.).—An excellent compost consists of good fibrous peat with sharp sand to keep it open. Efficient drainage, proper watering, and firm potting are also necessary. When once plants which are firmly potted in peat become dry ordinary waterings are not sufficient to moisten the soil thoroughly. They must be watered again and again until the water pours from the hole in the bottom of the pot. Indeed, if the dryness is allowed to go too far there is nothing for it but steeping the pot in the cistern until the air balls, which are displaced by the water, cease bubbling up. After the ball is thoroughly soaked no more water should be applied until necessary, when an ample supply should be given. This is one of the secrets in successful Epacris growing. Another, as we have said, is firm potting. Another consists in growing them in an airy greenhouse, where as little fire heat as possible is used, and where a constant circulation of air is maintained on all favourable occasions. After the flowers have faded the growth should be pruned. Erect kinds must be cut back close to the old wood, and drooping forms scarcely so far back. After they are cut back they should be kept rather close until they begin to grow again, when, if necessary, they must be placed into larger pots. After they have fairly recovered from cutting back and potting they should be plunged in ashes out of doors for the summer. By the end of September they ought again to be housed.

Exhibiting Trebbiano Grapes—Qualifications (Trebbiano).—We have seen bunches of this Grape successfully exhibited later in the season "against other white varieties, excluding Muscats." We have also more than once seen first-class samples of it defeat comparatively inferior Muscats. Most good judges of Grapes take into account the cultural merit displayed in exhibits, according to the respective varieties, and do not, so to say, fall down and worship second and third-rate Muscats. In the R.H.S. rules for judging Grapes it is stated that "the bunches should be of uniform size, of perfect shape, properly thinned, so that every berry has had room to develop, the bunch when cut remaining compact. Large bunches, with berries varying in size, are less meritorious than smaller bunches with berries of uniform size. The berries should be large for the variety, and carry a dense bloom. Loose bunches, ill-coloured berries, rubbing, shanking, spot, insect marks and mildew, are all grave defects." Read also very carefully the conditions attached to every class in the schedules of the shows at which you think of exhibiting, and act in accordance with the stipulations. In the great class at Shrewsbury, for instance, you will find that "neither size of bunch, as such, nor flavour, is to carry primary weight, but superior cultivation and finish for the respective varieties, as large bunches may have inferior berries, and the flavour of all varieties cannot be fully developed at the time of the show." We cannot make the matter clearer than by citing the above two sets of conditions, and there is no conflict between them.

Azaleas after Flowering (Tyro).—It is essential to the future well-being of the plants that you keep them under glass, affording a moist and somewhat warm atmosphere, so as to encourage them to make a good growth. When that is complete, and the points of the shoots are thickening a little, they may be placed outdoors in a sheltered situation on a thick bed of ashes, either naturally or artificially shaded for a few days, or the sun may prejudicially affect the foliage. The plants are generally sufficiently grown and the wood ripened as to admit of being placed outdoors by the middle of July. It is entirely a matter for judgment from the condition of the plants. They must be housed before the last week in September.

Dividing Asparagus (Finchley).—It is by no means good practice to lift and divide thick clumps, as the plants or divisions do not grow at all well, the check being too great; hence the best plan is to fill up the gaps by planting one or two-year-old plants from seed in the spring, preferably when they are starting into growth, or early in April, setting carefully, and without injuring the roots or crowns of the old plants. Some growers make the gaps in old beds good by sowing seed early in April, inserting the seed in holes about an inch deep, and two seeds in a hole, the holes being 15 to 18 inches apart, and so made where the bare places are to fill them evenly, covering the seeds with fine soil. The young plants from the seeds will gain strength from year to year, and produce heads in the third year fit for cutting.

Mildew on Vines (Copley).—The bunches and leaves are seriously infested with mildew, and unless you arrest the spread of the fungus at once the crop will be spoiled. See reply to "J. D." on page 481 last week. But in consequence of the extremely thin leaves we do not advise the heating and sulphuring of the pipes as there recommended. Your safest plan will be to dust the bunches, covering every infested berry with flowers of sulphur, through muslin, or some other way you may devise, and let it remain on them for three or four days or more: you may dust the leaves also, especially on the under side; or they may be sponged with a mixture of sulphide of potassium at a strength not exceeding $\frac{1}{2}$ oz. to 2 gallons of water, in which 2 ozs. of soft soap have been dissolved. If all the leaves are like those sent the Vines are in a weak and unsatisfactory state. You say nothing about the border, so we cannot advise on that: but observing signs of scorching we suspect the house has not been judiciously ventilated. It has probably been left closed too long in the morning. It should never be entirely closed at night, and further ventilation ought to be resorted to in advance of the rising temperature. Avoid late syringings or damping. Maintain a genial night temperature, not less than 60°, and a buoyant atmosphere. Do not overcrop. The bunch sent is insufficiently thinned. Unless you proceed with promptitude and judgment you may have a general collapse. We hope, however, the majority of the leaves are better than those sent.

Thistles and Nettles in Meadow (C. C.).—1. Drain the land if necessary. Many fields infested with Thistles have a wet subsoil. 2. Draw every Thistle in the early summer months—April or May—or as late as can be done without trampling down the herbage and spoiling it for cutting, using a pair of "reps," a toothed pincer-like implement with 3-foot handles, common enough formerly, but now seldom seen; or cut off the Thistles below ground with a spud, which at the same time delivers a little salt or kainit on the rootstock. This attended to, there will be a greatly lessened number of Thistles in the hay crop. 3. In autumn or rather late summer repeat the spring treatment with the Thistles in the aftermath or "fog." When in pasture, cut the Thistles in summer, July or August, always when or before "nopping" for flowering. Better use the "reps" or spud persistently from spring to autumn, never allowing the Thistles to make much growth. This practice is that we have found most successful, but permanent riddance seems out of the question, as so many seeds are broadcasted every year over cultivated land from waste places, and even from so-called farmed lands. For lawns the weeders that drop a little weed-killer on the cut-off root of coarse weeds answer well, but we have not tried the process on Thistles in meadows. As regards the Nettles, there is no better plan than to uproot them bodily with a drag hoe, a strong iron implement made by blacksmiths, which tears up the rootstocks and the creeping roots, every part of which should be removed and cleared off the meadow. Spring time is the best to operate against the Nettles.

Names of Plants.—We only undertake to name *species* of cultivated plants, not wild flowers, or varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in securely tied firm boxes. Thin paper boxes arrive in a flattened state. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool or paper the worst. Those arrive in the best condition that are so closely or firmly packed in soft green fresh grass, as to remain unmoved by shaking. No specimens should be sent to rest in the post office over Sunday, on which day there is no delivery of postal matter in London. Specimens in partially filled boxes are invariably injured or spoiled by being dashed to and fro in transit. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (C. D. B.).—*Cyrtanthus Maekeni*; see *Journal of Horticulture*, April 7th, 1898, page 309. (W. Bedding out plants in variety from 3s. doz.

RABBIT LAND.

THIS is the name by which shortly will be known a very large tract of England. When men like Lord Walsingham and Mr. Rider Haggard talk seriously of the impossibility of making farming profitable, and that rabbit warrens are the only alternative to barren common, we must come to the conclusion that at any rate some districts are in danger of becoming depopulated.

No doubt the land in question is very light and sandy, and was only taken into cultivation owing to the high price of grain many years ago, but there are numbers of such tracts of country spread about England to which the same description would apply, and the great question is this, "Is it necessary that such or any land should be turned into rabbit warrens?" Well! It is all a matter of money. Sentiment is not considered nowadays, and a profit is the only thing to take into account.

Although we have not farmed rabbits ourselves we have seen it done, and have seen 400 to 500 couples of good rabbits taken from a 10-acre field, the said field being also stocked with cattle and sheep, as occasion required. It was not good land. A few acres might have been classed as medium, but the remainder was poor sand, and the surrounding fields were worse if anything. One has since been let at 5s. per acre and another has gone out of cultivation and was subsequently planted with forest trees.

Now, we have long since come to the conclusion, but it was only forced upon us by bitter experience, that all calculations based upon expected profits from land must be subjected to very heavy discounts, and therefore we must not be too sanguine in reckoning profit on rabbits, but 400 couples at 2s. 3d. come to £45, or 22s. 6d. per acre, which is not to be despised as only a part of the return from land rented at about 10s. per acre.

Where a field is near the farm premises no doubt it is useful as accommodation from the strictly farming point of view, even if it be heavily stocked with rabbits, but if farther away the rabbits and a very scanty flock of sheep must be looked upon as the only rent earners. But why should so much land go back to a more or less primitive condition? The wages question is the answer.

We can remember the time when hands could be found at moderate wages in every village to go to work amongst Potatoes, Carrots, or fruit; to go even further, the farmers who opened up new industries in these directions were looked upon as public benefactors, and so they were. But foreign competition in the produce markets, added to home competition in the labour market, has made it impossible in remote country places to continue to grow such crops at a profit. In many instances the necessary hand labour cannot be obtained at all.

The irony of the thing is fully realised when we are told that it is no use to grow Strawberries except near large towns—not on account of the nearness of the markets, but the abundance of hand labour. So we must suppose that the low-rented farm labourer is better off on a low wage than the high-rented town dweller on a higher wage, or his family would be more ready to earn casual wages.

Look at it from whatever point we will, it seems evident that with a continuance of present prices much land will be transferred from the dominion of the plough to that of the rabbit, which will not be again disturbed until the whole country is one mass of terraces and villas.

The price of grain being so unremunerative, could not such land be cheaply cultivated without corn crops? A good stock of rabbits could be kept without doing very serious damage, but the first difficulty would be almost insurmountable. Horses must be kept, and straw of some kind, as well as hay, must be provided. They might be purchased, but in most cases there would be sufficient better land which would profitably grow corn and provide the necessary fodder, for not many horses would be required if the land were cultivated as we should suggest.

The basis of our ideas is a three or four years temporary pasture to be grazed as long as the returns from sheep and rabbits are sufficiently large to warrant letting the land lie still. The seed mixture to produce such a pasture on bad soil should contain Ribgrass and Kidney Vetch, in addition to White Clover, Perennial Ryegrass, and a little Alsike.

As soon as the pasture becomes mossy and bare, being thus of very small value for sheep, it had better be broken up in autumn and worked about, then ploughed down about 8 or 9 inches before December 1st.

The idea is a crop of Potatoes, but the soil must be well decayed before spring if it is to be of the utmost possible benefit to the crop.

No farmyard manure being available, the Potatoes must be grown without it, but with 4 cwt. of superphosphate and 2 cwt. of sulphate of ammonia per acre put on when the Potatoes are planted, should go a long way as a substitute for the muck. If nightsoil could be obtained at reasonable cost, and the carting were not too heavy, a moderate dressing, say 4 to 5 tons per acre, might pay in the crop and

leave a valuable residue for the future, but it must be applied in autumn before ploughing.

If the land be in a warm district and not very subject to spring frosts, with an aspect to the south or east, second early Potatoes such as Myatt's or Snowdrops, might pay the best, but under other conditions strong growing late sorts, like Up-to-Date or Imperator, would be more suitable. Get the crop up as soon as ready and sell it for early delivery; even the late sorts should have gone before December. After the Potatoes take a Turnip crop, which will not need much preparation after the Potatoes have partially cleaned the land. A moderate dressing of super and bonemeal will be necessary to grow a good crop of roots.

The next course must be Rape sown the end of April broadcast, and with it the seed mixture for re-seeding the temporary pasture. The Rape should be sown at the rate of 7 lbs. per acre, and another dressing of super, say 3 cwt. per acre, will pay either in this or the young seeds to follow. Of course, if the rabbits are not too numerous, or it is thought worth while to use wire, a corn crop may be grown as a cover to the young seeds and the Rape course left out. It is all a matter of calculation as to the probabilities of the grain crop paying for the extra expense. The straw must be estimated at a fair consuming value in deciding this question.

WORK ON THE HOME FARM.

The weather now is simply splendid, and Turnips have been sown in fine order. The land, warmed by the bright sunshine, has made an ideal seed bed, and there should be no question about the crops. We hear of a farmer or two grumbling, and wanting rain. We fear that spring corn has not done too well, has gone away, and lost plant from the ravages of wireworm. No doubt a few genial showers would assist such crops to recuperate, but warmth is the great thing needed—warmth without night frosts.

Rain could not be needed for the Turnips yet, for if the land has been sown quickly after ploughing the moisture must have been ample, and the tilth an ideal one.

Wheats are growing well and looking grand, as might be expected with ample sunshine. One or two fields which looked thin a month ago now appear to be as full as they can hold of green blades.

We are glad to hear and read of the widespread and systematic experiments which are taking place in the spraying of sulphate of copper, with the object of destroying Charlock or Ketlock. We have seen the immense damage done by this noxious weed, and a remedy for it will be a great blessing to farmers. Can a benefactor find an antidote to the common field Poppy? for we believe this to be a greater and more destructive enemy than the other.

It is certainly quite as inimical to crops amongst which it grows, and is more difficult of eradication, whilst the seeds being smaller and more numerous it spreads infinitely faster.

Clover and hay are growing rapidly under the influence of the hot weather. A few showers would do them good and help them to become longer, and therefore heavier in bulk, whilst putting off the haymaking season a little. A postponement we can well do with, for work is very plentiful. Potatoes are growing fast, and require both horse and hand hoeing, and will soon be ready to earth-up. The sulphate of ammonia top-dressing, 2 cwt. per acre, goes on this week.

THE HAY HARVEST.—During the brilliant weather it is reported that rapid progress has been made with haymaking in Berkshire and Hampshire. In several places the crop was secured and ricks got up in capital condition. The growth is rather thin in some places, but on the whole the reports in these counties are satisfactory.

DAHLIAS! DAHLIAS!!

Ware's

UNRIVALLED COLLECTION

We are now Booking Orders for Immediate Delivery.

Special attention is drawn to the two following beautiful
NEW CACTUS VARIETIES for 1899.

Early Orders are solicited as the stock is limited.

E. O. GREENING.—Purple, shaded crimson, medium sized flowers, long and twisted petals; very free flowering; 2½ to 3 feet high. 5/- each.
SYLVIA.—Silvery-lilac shaded rose, splendid shade of colour, wonderfully free blooming, a splendid flower for cutting, lasting very long when cut; flower stem long and stiff; 4 feet in height. 5/- each.

NEW CACTUS DAHLIAS, Vars. of 1898.

Including such sorts as:—ARACHNE, CAPSTAN, FALKA, ISLAND QUEEN, LAVERSTOCK BEAUTY, RUBY, &c. 2/- each

CACTUS DAHLIAS, General Collection.

All the leading varieties. Our selection, 5/- doz.

SINGLE CACTUS DAHLIAS (New Type).

Our selection, 5/- per dozen.

DAHLIAS.—Singles, Pompons, Shows, and Fancies, in great variety. Our selection, 5/- per dozen.

BEGONIAS.

WARE'S GOLD MEDAL and 1st PRIZE STRAIN.
(If required started into growth, an intimation should be given to this effect).

Single—Mixed, 3/- per doz.; 20/- per 100.

„ To colour, 5/- doz.; 32/- per 100.

„ Extra choice, for Conservatory or Exhibition, 9/- and 12/- per doz.; 65/- and 75/- per 100.

„ Named sorts, splendid forms and colours, from 1/6 each.

Double—Mixed, 5/- per doz.; 35/- per 100.

„ To colour, 8/- and 10/- per doz.; 60/- and 80/- 100.

„ Gems for Exhibition, 18/- and 24/- per doz.

„ To name, THE FINEST EVER OFFERED, from 36/- per doz.

DAHLIA CATALOGUE, containing Illustrations of many new sorts, and list of varieties with full descriptions, post free upon application.

N.B.—All Orders amounting to 20/- and upwards when accompanied by cash, are sent Carriage and Packing free.

MIDDLESEX.

BEGONIAS for 1899.

B. R. Davis's New Catalogue will be sent to all purchasers of this popular flower. A correct Descriptive List, with revised prices, of one of the largest and best collections in existence. Also

B. R. DAVIS'S NEW GARDEN ANNUAL.
For purchasers of first class, reliable Garden Seeds and Plants.

B. R. DAVIS,
YEOVIL NURSERIES, YEOVIL, SOMERSET.

"SUNPROOF" Shading.

An entirely new Glasshouse Shading, sold in 6d. 1lb. tins, to be washed on the glass with cold water, as if it were soap. Guaranteed to be one-half the price, and to be the only shading in a solid state ready for use without the waste of time and material in being prepared, and to be superior to any other shading. Try it for yourself, and if not entirely satisfactory your money will be returned.

S.M. TREE FASTENERS.—The cheapest and best method of fastening plants and trees to walls. Being made of pure soft lead and not fixed to the nails (like patent wall nails, which when the nails get broken the article is useless), they may be used with ordinary nails for a lifetime. Under 2d. per dozen.

S.M. CLIPS.—To be used in the place of raffia, &c., for tying all plants to stakes, &c. Fastens instantly, and is everlasting, so saves time, trouble, and expense. 1d. doz.

FLOWER GRIP HOLDERS.—The only self-making buttonhole, watertight flower-holder ever invented, and the best for show and other purposes. Price 6d.; ladies', 9d.

IVORINE PLANT LABELS of every Description, guaranteed the cheapest Imperishable Labels, and the wording legible and permanent. Samples free.

WATERPROOF INK, for writing on all kinds of Labels, whether wood or metal. The only ink to stand the outside weather. Price 7d. Bottle.

GARDENER'S FOUNTAIN PEN, filled with the waterproof ink, 1/-.

Send for Illustrated List, with samples, for further particulars and other articles of the

DRY BUT IMPORTANT.

MAKING a mass of figures interesting to the majority of readers, and especially those who enjoy light literature, is a task which few persons can successfully accomplish. No attempt will now be made in the direction indicated, and, therefore, notice is hereby given to the light reading fraternity to skip this page, as the matter is intended for the thoughtful who desire to see the soil of their native land turned to the best possible account in the production of health-giving and wholesome food by enterprising and intelligent cultivation.

We have been glancing through the "Agricultural Returns for Great Britain"—a stupendous array of figures truly, though of unquestionable importance, and a few citations from them will not be unacceptable to the large community of readers who are interested in the demand for and the supply of hardy fruit. That the demand, great as it is, will increase is certain, and the better the supply forthcoming the greater such demand will be.

Another certainty may also be mentioned in this reference—namely, no matter to what extent the demand may grow it will be met by the cultural resources and commercial aptitude of other countries, just in so far as the shortages in our home grown supplies afford opportunities to our trans-oceanic competitors to fill the vacuum that these shortages may create. That, we think, is a concrete economic fact, and it is well to look it fully in the face and accept, as we must, all resulting possibilities.

Turning to the official records, we find it stated that the importation of Apples into the United Kingdom from foreign countries and British Colonial possessions during 1898 amounted to 3,458,646 bushels. This is the smallest bulk with one exception since 1891—namely, in 1895, when the importations were 166,384 bushels fewer.

In 1897 the arrival of Apples from abroad amounted to 4,199,921 bushels, and in 1896 to 6,176,956 bushels, or an excess of no less than

*Eyre and Spottiswoode, East Harding Street, London.

No. 2647.—VOL. C., OLD SERIES.

2,718,340 bushels over the imports of the past year. The (1898) figures are, however, probably incomplete, for it is stated in an explanatory note, "they were taken from the accounts relating to trade and navigation, and are therefore subject to revision."

Taking the returns for 1897 as accurate it may be interesting to note whence the produce came. From foreign countries it amounts to 2,991,215 bushels; from British possessions 1,208,756 bushels; total, 4,199,971 bushels of Apples to eke out our inadequate supply.

Of the foreign Apples the United States of America sent more than half the bulk—1,808,115 bushels, the other chief contributors being Holland, 386,677; and Belgium, 382,914 bushels respectively. France sent us 172,981, and Portugal 145,934 bushels each. Then follow Spain with 58,824, and Germany with 26,958 bushels. Much smaller consignments came from Italy, Madeira, Norway, Sweden, Denmark, the Azores, and the Canary Islands, these amounting in the aggregate to 8600 bushels of our staple fruit.

From British possessions Canada sent us nearly six times as many Apples as all other colonies put together. Tasmania contributed 135,495 bushels, the remaining parts of Australasia 30,723 bushels, made up of 20,500 from Victoria, 10,050 from South Australia, and 173 bushels from New South Wales. The Channel Islands sent 21,603 bushels, while the Cape of Good Hope is only credited with helping us to the extent of 6 bushels of Apples.

Passing to other kinds of hardy fruits enumerated—namely, Cherries, Pears, and Plums—we find considerable importations; or in 1897—the last completed figures—Cherries 312,294 bushels, Pears 1,051,817 bushels, and Plums 1,043,819 bushels.

No British possessions are credited with sending us Cherries. France, with 192,686 bushels, contributed more than all other countries combined. We received from Germany 57,214, Holland 40,403, and Belgium 21,546 bushels respectively, while Spain sent 413, and Norway only 32 bushels.

Among foreign exporters of Pears to this country Belgium heads the list with 529,095, France following with 269,142 bushels. Holland comes next with 134,468, while the United States sent 86,862 bushels. The consignments from Germany are 22,994 bushels, Denmark, Portugal, Spain, Italy, and Morocco contributed in a small way, making the total bulk of Pears from other than our colonies and islands 1,043,989 bushels. We received 4751 bushels from the Channel Islands, 2654 from Canada, and 247 bushels from the Cape, while 212 came from Australasia and 24 from Malta, making the total Pear imports, as above stated, 1,051,817 bushels of fruit.

We are indebted to other lands for nearly the same huge bulk of Plums, all but 828 bushels (449 from Canada, 367 from the Cape, 9 from the Channel Islands, and 3 from Australasia) coming from foreign countries. France is the chief exporter, with 509,934 bushels, Germany following with 286,905, Holland sent 149,503, and Belgium 89,900 bushels. The United States contributed 5352 bushels. Denmark, Sweden, Portugal, and Norway helped, but only to a slight extent, in making the total Plum imports 1,043,819 bushels.

Of the hardy fruits named, Apples, Cherries, Pears, and Plums, we have to recognise the significant fact that our shortage—the inadequacy of our home grown supplies for meeting the requirements of our population—was no less than 6,617,951 bushels for the last year (1897), for which authoritative returns are presented by the Board of Agriculture. That is something to be pondered over by owners of land, which is capable, under intelligent methods of cultivation and appropriation to the respective kinds, of growing produce of the highest quality for our markets.

The hard unyielding figures cited afford the most powerful confirmation of the dismal allegations of those so-called growers of hardy fruits, who bungle and fail, that planting is being overdone; on the contrary, it is only by systematic planting and sound management that fruit can be grown in the bulk and quality requisite for meeting the ever increasing consumptive demand. It cannot be afforded by enfeebled and service exhausted trees, but only by the young, fruitful, and well constituted, and these in the best varieties of the respective

kinds. Nor can it be grown by everyone and everywhere. The policy of snatching at the cheapest of trees, regardless of varieties, sticking them anyhow in any vacant land, and leaving them to take their chance, has gone on too long. It can only end in disappointment, except to skilful cultivators at home and abroad, who have, because of the failure of others, the better opportunity for disposing of their own superior wares.

It would be easy to collate more startling figures than those we have taken from the Government returns, such as the importations of other kinds of fruits—Oranges, Lemons, naturally grown Grapes, and other tropical kinds, including Nuts, bringing up the total importations to nearly 20,000,000 bushels; but it would be misleading as affecting British cultivators, and that is no part of the policy of the *Journal of Horticulture*.

It may be incidentally mentioned that nearly 1,000,000 "bushels" (what a term to employ!) of Grapes were imported last year, the overwhelming amount, however, being naturally grown in Spain and Portugal; but upwards of 40,000 bushels came from the Channel Islands, and 21,000 bushels from Belgium—presumably grown under glass. British growers can, all the same, be left to look after themselves in this reference.

Reverting to the subject of hardy fruit, we seem to be making some progress, as an increase of over 1900 acres of orchards, cultivated and under grass, is recorded for the year, though the area under bush fruits appears stationary.

Another point may be touched on. We appear to have imported nearly 7,000,000 cwts. of Potatoes during the past year, valued at nearly £2,000,000; also over 6,000,000 bushels (why not cwts.?) of Onions, value almost £800,000, an increase on all previous years, notwithstanding this era of "onionism"—i.e., gigantic home-grown bulbs.

On the general question of the inability of the nation to feed its population we note some astounding figures. The total vegetable products imported into the United Kingdom during the past twenty years amounts in value to £84,281,440, and the total agricultural food products to the tremendous sum of £155,807,377! On contemplating such figures, based on facts, two questions of fundamental importance force themselves to the front.

1, What would be the condition of our dense population in the event of this country being driven into a prolonged general war?

2, Is all being done that it is possible to do in various ways for developing the food-producing resources of our sea-girt isles?

Dry as this brief narrative of our food dependencies on other lands may be, we are disposed to think he will be a bold man who questions the importance of the subject.

NOTES ON SOME INJURIOUS INSECTS OF 1898.

THE season of 1898 was on the whole not what the majority of gardeners would consider a favourable one; it was marked by great dryness in most districts, with transient showers, sometimes violent, and the coldness of the early summer was followed by heat that was often scorching. Within my observation it was not a year when insects generally were numerous. I should say our foes in gardens, orchards, and shrubberies did less mischief than is usual, the weather being frequently unfavourable to their emergence or increase. Cold winds killed multitudes of young caterpillars; very dry weather proved a check to the appearance of many moths, also the foliage became tough on some trees and shrubs, so that beetles or larvæ could not obtain nutriment. Many flowers died off rapidly before the insects that fed on them were full-grown. Even those species that feed on the roots or crowns of plants suffered in a degree from the high temperature and deficient rainfall. This present spring, too, being cold and not very moist has thus far not helped our insect enemies.

Miss Ormerod, whose labours have, with the assistance of her many correspondents, helped to spread the knowledge of entomology amongst farmers and gardeners, in her twenty-second annual report states that though few hurtful insects were remarkably abundant, yet there were some singular variations in the kind and extent of insect infestations. Ground beetles of several species were plentiful and active, specially those attacking Strawberries. For some years it had

been reported that Potato haulm was seriously injured in various localities by the tunnelling of a caterpillar, and one species at least was identified last year. Aphis of many kinds, the too well-known "blight," was abundant; this group of insects can stand cold winds and summer drought. Towards autumn very numerous complaints were made by gardeners and Cabbage growers of the mischief traceable to caterpillars of the white butterflies, which occurred in ravenous multitudes. But on the other hand the cornfields suffered little from the tiny enemies of stem and grain. Surface caterpillars were about indeed, yet did no great harm; and the host of leaf-devourers, often complained of during May, were conspicuous by their scarcity.

Coming more to detail, we will begin with the Strawberries, which are just now arriving in the markets—a fruit so much valued by us that our ire is roused against insects that audaciously take it from our mouths, so to speak. It is certain the beetles complained of have in some neighbourhoods seriously reduced the crop. Miss Ormerod states that these eaters of our Strawberries were first reported to her in 1894, but I believe ten years before that they were mentioned in these pages, one species in particular getting from some gardeners the name of "Black Bob." Very dingy indeed most of these beetles are, if not all of them black; the chief offender, *Pterostichus vulgaris*, is wholly black and glossy, with a striated back and no wings. That fact, of course, prevents such beetles from travelling across the country. Two other species observed on the Strawberry are wingless also, or have them undeveloped usually. The second in importance, however, *Harpalus ruficornis*, possesses wings, and the insects have been seen at night flying in parties, after the manner of cockchafers; this species is of a reddish brown. What surprised the entomologists was, that all these beetles belong to a family believed to be thoroughly carnivorous or predatory in habit; certainly the larvæ or grubs are, which is something by way of a set-off. The beetles themselves have a liking for meat as well as Strawberries; this suggests a mode of trapping them.

During daylight they hide, after sunset they may be searched for with a lantern, but this is tedious work. Laxton Brothers, of Bedford, state it is more satisfactory to bait a number of pudding basins with pieces of lights and sugar water. These are sunk into the ground level to the surface at night, and examined next morning. By another gardener it is reported that thousands were caught in rows of condensed milk tins placed along the beds, with half an inch of tar at the bottom. Two instances are recorded last year of Strawberries being damaged by the cockchafer grub. On the Continent this insect is frequently detected lying at the roots of these plants, seldom here. On our island it is too well known as a foe of Turnips and other root crops, also infesting grasses, and attacking young trees in nurseries.

"Black Bob" has a near relative, *Pterostichus madidus*, which has, for thirteen years, been noticed as a cause of injury to Mangold roots, attacking them at night during June. From the time the attacks are made they are overlooked, the beetles hiding by day. An observer last summer noted that the choicest varieties, and most valuable for feeding purposes, are singled, the plants being cut off just above the roots, the leaves are seldom touched. Evidently remedial measures must include the destruction of the grub or maggot which has produced the beetle, if that can be secured; at present the habits of the species are scarcely known. A much smaller beetle was noticed again in May and June, 1898, injuring the crops by gnawing little holes in the germinating plants, so that they die before appearing above ground, or later, biting the tap root and leafstalks. This is *Atomaria linearis*, only half a line long, blackish or brown, possessing wings, and is busy in the day occasionally, as well as at dusk. Where the species has been noticed it appears by myriads, but it has never been generally distributed, though Curtis mentioned it many years ago in his "Farm Insects."

Last year's report brings out some facts important to all the possessors of orchards, though, as a rule, shortness of crop was seldom traceable to insect foes, but arose often from other circumstances. But the Pear gnat midge was more abundant and injurious than in any year since 1883, occurring, however, chiefly about South England. This insect (*Diplosis pyrivora*) is a tiny two-winged fly; it has black head and thorax touched with grey, the body brown tipped with whitish hairs, and the dusky wings have a fringe of hair, there is an ovipositor in the female. During spring, they deposit eggs on the blossom, sometimes before it is opened; the grubs hatch speedily, when removed from the fruit they have the power of jumping. One remarks, "The Pears swell up to the size of a sparrow's egg, and, if you cut them open just below the eye, you find about a dozen of these small maggots. In a week or fortnight the Pear becomes black where they have eaten the inside away, then they disappear; usually the Pear falls to the ground, but some remain as deformed fruit on the tree." Of course, all fallen Pears should be burnt, and it is recommended to shake trees

that are attacked, to get away every Pear that is infected with maggots. Since the cocoons are formed on the earth under the trees, skimming off the surface soil in the autumn has been recommended. But Prof. Smith of New Jersey reports that the best remedy is a good top-dressing of kainit; an almost equal result, however, was attained by free sprinkling of nitrate of soda.

There is an Apple-haunting insect, which probably does every year a certain amount of mischief, that escapes notice; but last year several complaints were made from different localities. Henceforth gardeners must keep watch for it. The maggot has the habit of destroying hunches of Apple blossom by tunnelling up the shoot beneath them. The moth is called the pith moth, *Laverna atra*; it is minute in size, deep brown streaked with white, and flies in July, when the eggs are laid. Evidently the young caterpillars hibernate under the bark of an Apple twig, then in May bore along the wood of a growing shoot, devouring the pith. They pursue a different plan to that followed by the red bud caterpillar, which infests the Apple in May, and first feeds on the blossoms, spinning them together, then finishes off upon the leaves. This insect, common on the Continent, is seldom noticed in Britain. Little can be done with either, except to pick off any shoots seen to be affected at the tips. The conspicuous caterpillar of the buff-tip moth has been taken upon Apples in several places, both North and South of England.—ENTOMOLOGIST.

FLOWERS IN DRY WEATHER.

A WELL-KNOWN book—which I must confess I have never read—bears the taking title of "How to be Happy, though Married." Gardening has so many difficulties that one would think a volume entitled "How to be Happy, though a Gardener," would run through many editions. I am not going to discourse to my readers in the familiar style of the "Chaplain to the Forces," whose wise words (I speak from *parole* knowledge only) have, it is to be hoped, brought peace to some unhappy households; but I desire, at a time when drought prevails, to see what nectar and comfort one can extract from the flowers of the time. If things wilt and look forlorn for want of the refreshing rain there is no reason why we gardeners should seek coolness and oblivion in that slough of despond which seems so convenient. While we are at the use of means to keep our favourites alive, we may, at the same time, think happily of the beauties of many things. Toil there may be, and is; but the brilliancy of the sun brings with it much of charm and many bright features.

The time has gone by for the Poppy to be looked upon with dread or despised, as in the Elizabethan days. We may not, like the ancients, dedicate it to Ceres; but we look upon it as one of Flora's gifts, carrying to us, in its brightness and gaiety, joy and lasting pleasure, though its flowers in themselves are only fleeting. In these dry days, in which the Poppy appears to delight, the great blooms of the Eastern Poppy (*Papaver orientale*) glow in the strong sunlight. If we use this Poppy wisely we need not call it garish and gaudy. Smaller and different in every way are the flowers of *Papaver rupifragum*; more delicate and fleeting in their beauty, their soft salmon colouring is less obtrusive, even when they seem to reflect from their shining crinkled petals the sunlight's rays.

As one grows it longer, one learns better to appreciate Mr. J. Carrington-Ley's hybrid between *P. orientale* and *P. rupifragum*. Like a small Oriental Poppy in its general features, there is about it an almost undiscernible, subtle, pleasing reminiscence of its other parent, which gives refinement to its blooms. Cheering also are the flowers of the other Poppies, such as those of the dainty, delicate, little *P. alpinum*; the more robust *P. nudicaule*, varied, like the Alpine Poppies, in their colouring; the exquisite Shirley Poppies; or the deep scarlet, jet-black spotted blooms of *P. umbrosum*.

To no flower seems the dry weather more welcome than to the old double white Pink. How soon rain defaces the beauty of its lacinated petals, and changes their grace into decay. We have no sweeter flower than this. One would almost think that the fringing of its petals had been done of set purpose, so that there might be more opportunities for the diffusion of that sweet fragrance which is so welcome as we draw near. Did the long drought but lengthen our enjoyment of this delicious perfume it would not fail to bring some balm of comfort.

From the old white Pink with its odour to the Australasian *Olearia stellulata* seems a long leap. The latter has no fragrance to recommend it, but, like the songless bird, it has its beauties. If it cannot waft to us a perfumed breath it can give us the snowy whiteness of its lowlier companion, and the masses of white Daisy like flowers look cool and refreshing. Like the Pink, dry weather prolongs its beauty, and one can but think with some apprehension of these great sprays of flowers, with which the grey bushes are so covered, being defaced by the needed rainfall. Compared with it,

its congener, *O. ilicifolia*, seems poor and unsatisfying, though it has beauties too.

Seeming to revel in the drought and the sunlight are the *Cistuses* and *Helianthemums*. But for their tenderness the former would be among the most useful of our summer-flowering garden plants. Looking at the beauty of the few which can be trusted to live outdoors for a few years, one is reminded of great bushes in more southern gardens laden with brief-lived flowers, dazzling in their brightness and loveliness. I shall not attempt to deal with the synonymy of the *Cistuses*. The Rev. C. Wolley-Dod can tell of it better than I. It is enough to look upon a bush of the one which passes as *C. corbariensis* with many, but which the Kew Index calls *C. salvifolius*, with nigh upon a hundred open flowers. Of the *Helianthemums* one has so often spoken that they may almost be left alone; yet there are no better dry weather plants. As one gazes upon their bright little flowers they recall a fine rock garden in Surrey, where on the chalk they are more delightful than in my own garden.

How much we are influenced by imagination is realised when one wanders to the little Water Lily pool and studies the floating leaves and swelling buds of the *Nymphæas*. A sensation of coolness comes over us as we look upon the pool with its aquatics and its fringe of surrounding plants which delight in the moisture they can draw at will. Cool does it feel as we look upon the *Iris*es with their fresh leaves and their bright gay flowers. They bring to us the remembrance of Longfellow's poem, which also seems, in some degree, to waft to us a thought of refreshing breezes and cooling waters. We may join in spirit with the departed singer of sweet songs and say—

"O, Flower-de-luce, bloom on, and let the river
Linger to kiss thy feet;
O, flower of song, bloom on, and make for ever
The world more fair and sweet."

—S. ARNOTT.

CHOISYA TERNATA.

I CAN fully bear out all that Mr. Abbey says of this useful shrub on page 465, and as to its relative hardiness, I think I may venture a step farther than your contributor, in that the shelter of a wall having a sunny aspect is not absolutely necessary in the West of England. Here in the pleasure grounds a plant has stood for many years, and had the reputation at one time of being one of the largest seen in such a position. Its dimensions are not now what they were six years since, the two cold winters of such severe and prolonged frosts cutting all the older stems down to the ground. This season it has been finer than I have previously seen it, both in its wealth of blossom, robust health, and compactness in growth, which satisfactory condition is the outcome of the frost, necessitating the removal of all its branches, and the fresh and abundant sucker growth that has since issued. It has been most striking as a landscape object, and useful for filling vases in the house.

Its situation would not strike one as being very suitable, for it is shaded by tall adjacent trees, and occupies a position at the foot of a deep bank furnished with other shrubs. The spot is a delightfully cool one in summer, and still more so in winter, for while the summer sun is filtered by trees and shrubs on the south and west, cold winds from the north, west, and east furnish an extreme that would soon tell its tale unfavourably on anything not possessed of a good constitution. It certainly is a position that would be seldom chosen for the planting of a tender shrub, such as it was treated at the time it was planted here, and the soil being of a clayey nature would seem adverse rather than favourable to its welfare.

Taking all these points into view, I can scarcely define the shrub as a tender one, needing the sheltering influence of a sunny south or west wall. I should not hesitate to plant in less favourable situations, comparatively speaking, than those advised by Mr. Abbey, and considered necessary by planters generally. At the same time I consider that as a wall shrub nothing could give a better display than the *Choisya* when a position suited to its requirements is available.

In a Bristol garden I once saw a very fine and spreading plant growing in the angle of the mansion which, when in flower, pervaded the rooms with its pleasant perfume through the open windows adjoining. This had a favourable spot, and the extent of growth proved that the plant was well suited both in soil and aspect.

Mr. Abbey's advice to plant outdoors may well be repeated, especially to those who have been content to cultivate them in pots, and that, too, without much satisfaction from a floral point of view. Being strong in root growth, small pots cannot long support them, at any rate, not to furnish flowers sufficient to satisfy greenhouse requirements. I should hesitate to plant it in a conservatory unless the structure was of large dimensions, for the fragrance of a big bush would prove too much in a limited space. It is curious that a shrub so long cultivated by British gardeners should not have become more often planted outdoors, but the fact of its being cultivated in pots accounts to some extent no doubt for neglect outdoors.

There is an advantage in planting in sunny and shaded places in that a longer succession of flowers for cutting is furnished, and the additional feature which it produces while in flower in other than the sunny situation, but the one here plainly shows that it is not particular as to soil.—W. S., *Rood Ashton*.

ROSE SHOW FIXTURES IN 1899.

- JUNE 24th (Saturday).—Windsor.
 „ 27th (Tuesday).—Westminster (R.H.S.) and Southampton.
 „ 28th (Wednesday).—Bath, Croydon, Maidstone, Richmond, and Ryde.
 „ 29th (Thursday).—Canterbury and Sutton.
 JULY 1st (Saturday).—Crystal Palace (N.R.S.).
 „ 4th (Tuesday).—Gloucester and Harrow.
 „ 5th (Wednesday).—Brockham, Ealing, Hanley^o, Hitchin, Reigate (Redhill), and Tunbridge Wells.
 „ 6th (Thursday).—Co'chester (N.R.S.) and Farningham.
 „ 7th (Friday).—Hereford.
 „ 8th (Saturday).—Manchester.
 „ 11th (Tuesday).—Reading and Wolverhampton.†

 ‡ Show lasting four days.

—EDWARD MAWLEY, *Rosebank, Berkhamsted, Herts.*

HON. EDITH GIFFORD.

THIS is one of the most charming of the Tea Roses, its fine flowers being of great substance, white with a blush centre. It is also one of the hardiest and best growers, though, unfortunately, not so free as *Marie Van Houtte*, *Madame Lambard*, and one or two more of the best known kinds. What beautiful flowers these delightful Roses give us at this time of year, buds and fully expanded blooms being equally beautiful, though the latter are not, of course, so useful for cutting. It is a mistake to prune these kinds too hard; but, on the other hand, many growers leave in far too much weakly spray.—H.

ROSES IN POTS UNSATISFACTORY.

"I REPOTTED my Roses early last autumn in (as I now fear) soil unsuitable by being too light. I then left them out in the open, and they were subjected to very heavy rain for some time. This, I fancy, had the effect of washing out the nutriment and clogging the drainage. In spite of liquid and artificial manures I failed to get good results in the spring. Should I repot with better compost now, or leave them alone till the usual and proper time in the autumn? It is in February and March that I should prefer to secure bloom, starting the Roses with Vines about that time."—BRYN.

[We publish the above letter as convenient for giving a reply that may be useful to others as well as "Bryn." As to repotting in the autumn, unless the Roses need it, and the work is done in the right manner, in suitable soil, and this kept suitable, repotting them may easily do more harm than good.

If the pots of the failing Roses were fairly filled with healthy roots, turning the plants out, rectifying the drainage, and protecting it with turf or moss; rubbing off the loose surface soil with any inert particles, returning to the pots, then adding sound and slightly enriched turfy loam, working it down with a stick; then pressing the whole firmly together, and standing the pots on tiles or laths with an inch of space between them for the free escape of water, the plants would have flourished much better than by shifting them into larger pots in too light and insufficiently firmed soil, and taking no special precautions for effective drainage.

However unsuitable the soil used, it was made worse by saturation. Overwatering after repotting is one of the greatest of evils, and the greater the bulk of soil unoccupied with roots the greater the evil must be. If the drainage was "clogged" with soil, either the crocks were not properly protected, or the pots stood on a base which prevented the escape of superfluous moisture. In this case the nutriment would not be washed out, but retained, and the saturated soil by lack of air circulating through it would be soured—poisoned; while the roots, because they could not breathe, would sicken and die.

Giving liquid or artificials under such conditions would make matters worse, as such applications can only do good when there are active healthy roots to imbibe them, while if given too strong such roots as there are must be injured. We suspect our correspondent has

first erred in the method of repotting and arranging the plants, then in overfeeding.

As to repotting such Roses now (June), we can only say if they were ours and unhealthy, still recoverable, we should proceed as follows:—Have suitable and proper moist soil, with clean pots and crocks in various sizes ready; take a plant, turn it out, liberate the roots of loose and also sour looking soil, even if need be to half the bulk, or more; plunge the roots into an empty pot or two, and choose one which holds them comfortably though slightly coiling round or pressing against the sides; crock the pots thorough, and protect the drainage efficiently, then place in and press down the proper quantity of soil for raising the collar of the plant to within a little more than an inch below the top of the pot, then work fresh soil between the roots, not huddling them, and settle it with a few sharp raps on the bench; press down with the fingers, add more, finish level and quite firm an inch below the rim, stand the plant out of the sun in the shed, and syringe it forthwith. The whole process should be done in two or three minutes. Proceed with the others in the same way, letting them stand in the shed, keeping the leaves wet and the floor damp.

What next? If we had a sufficiently deep pit we should arrange them in it on a bed of damp ashes, put down the lights, and shade heavily if sunny, and syringe as often as necessary for keeping the leaves fresh. If we had no such pit we should make a shelter with stakes and mats all round, with rails across for supporting mats over the plants; stand these on tiles or ashes, keeping the base moist, and syringe as before; also expose to night dew.

With the leaves still fresh, the second day after repotting would probably be soon enough for giving the soil a thorough watering, which, with the syringing and shading, may last for a week. By that time if the leaves never flag, as they will not if kept wet, fresh root action will have commenced, then syringing and shading must be gradually reduced, and the plants will soon endure and enjoy full exposure. They must never get too dry at the roots before water is given, and the freer the root action and growth the more frequent the supplies, always copious, will be needed.

By such treatment, properly carried out, we should bring the plants round, ripen their wood during August and September, and not repot them in the autumn; but top-dress when starting them into growth. As to starting and blooming "Bryn" sets us a poser. He wants to "secure blooms in February and March, starting the Roses with Vines about that time." We give it up, as our Roses require a few weeks of growth after starting before they unfold their welcome blooms.]

HALESIA TETRAPTERA.

THE spray of flowers sent by "R. C. N." for identification represents *Halesia tetraptera*, popularly called the Snowdrop Tree, in splendid condition. It is not commonly planted, but it has a good habit of growth with pleasing foliage, and when in flower in early summer it is highly interesting, as the branches all bear a large number of pendant white flowers (fig. 111), which have a strong resemblance to the Snowdrop. It will grow freely and bloom profusely if planted in any garden amongst a general collection of trees, and all who know anything of good shrubs will always regard it as valuable.

PATCHY POTATO BREADTHS.

"W. S." asks, on page 491, for my remarks on the general condition of Potato breadth this season. They entirely coincide with his own, for generally I find the plants to be very irregular, having come indifferently, some coming late, and not a few making no growth. Now what are the causes of this irregularity? First there is the undoubted fact that whilst in hot dry seasons the Potato murrain or fungus does attack the plants, yet its effects are so much mitigated that thoroughly diseased or rotten tubers are uncommon. But in many of them there are fungus spores all the same, that are by the drought rather driven in than out. Were there much moisture in the soil the spores would soon run through the tubers and destroy them. For lack of the moisture the spores remain almost inactive, but still are there. Numbers of such tubers are planted in the spring, the planter not suspecting the presence of the fungus so concealed in them.

Many of these tubers put into the damp cold soil decay entirely, others sending up weak shoots, and late. Then there is the fact that open mild winters, such as the past one was, render the keeping of seed Potatoes restful a matter of exceeding difficulty; with many, except where favoured with stores of exceptionally cool temperature, impossible. Premature growth ensues, and either has to be rubbed off, or if allowed to remain, becomes long and weak, unless the tubers be kept not only in full light but in the air, and cool, even if the premature shoots thus

made be ever so carefully preserved there is the possibility that they may become broken in the planting, or may be injured by insects or other pests in the soil.

Then there is the undoubted fact that during the past spring the soil was as a rule very cold. I found its temperature to seriously affect the tuber-growth even when the planting was not done until the second week in April, and that is not early. In every case the sets were carefully selected, had been for some time exposed to light and air, and were, of course, all fully sprouted. But because the soil was so cold growth was most irregular, and it was some time ere any degree of evenness in growth was manifest. The breadths I have so far seen were on light porous warm soils, but still even on these soils there was seen ample irregularity.

Did we regard Potatoes more as tender warmth-loving plants than we

FIG. 111.—HALESIA TETRAPTERA.

do, we should defer the planting until we were in the month of May. No extent of growth seems to render Potato plants any more hardy. The native tenderness of the plant remains. Could we in our so common mild winters but manage to keep the seed tubers thoroughly at rest, and then were to plant them later, probably few blanks in the breadth would be seen. Even then there would always be possible trouble through dormant disease spores, but I do think the primary cause of irregular growth is to be found in the other cause I have indicated.—A. D.

UNDER this heading, "W. S." has drawn attention to a matter that might with advantage bear some investigation at the hands of your readers. Although not suffering in that respect, I can fully endorse the opinion that this year there are more failures amongst Potatoes than can be remembered for many seasons. I was recently inspecting what ought to have been a fine breadth of Reliance, and failures in scores were to be counted in one part, and on inspection we found many of those that had been cut to be quite decayed, the whole "sets" showing much the better average in every respect. From this I should imagine that the cold and rain immediately following planting had much to do with it, especially as the ground is of a heavy nature.—R. P. R.

RECENT WEATHER IN LONDON.—We have had a very refreshing shower since our last issue went to the machines, but by no means sufficient rain has fallen to penetrate to the roots of plants. On Saturday it was bright and warm, a pleasant shower falling on Sunday evening. Monday was close, dull, and threatening, and on Tuesday morning came the shower above referred to. The later hours of Tuesday were fine, as was Wednesday morning.

— ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, June 27th, in the Drill Hall, James Street, Westminster, 1 to 5 P.M. On this occasion special prizes will be offered for Roses, and at three o'clock a lecture on "Some of the Plants Exhibited," will be given by the Rev. Prof. Geo. Henslow, M.A.

— THE R.H.S. COMMITTEES.—The Council have issued their now customary invitations to the members of the respective Committees, a rather large body conjointly, to lunch at Chiswick on July 11th. Should other than members of the different Committees be invited to take part in the Conference on hybridisation, arranged for that day and the following one, the luncheon party will be a very large one. No doubt care will be taken, that apart from the special subjects of interest relating to hybridisation, that a good show will be provided, and also that there will be ample work for the Committees. No doubt also the gardens will be looking at their best: but it is hoped ere then, and indeed speedily, rain will come, as it is now much needed. The Chiswick gathering should constitute the most pleasant of all the Society's reunions.

— PEA HARBINGER.—This has been my best early Pea this season, and it is a variety that is worthy of extended culture, being extremely free bearing, and of excellent quality. When the size of a quarter of ground is taken into consideration, this will produce quite as many good pods as any other kind, and it is earlier than Chelsea Gem. The peas have a nice marrow flavour, and the pods, though not large, are well filled. It is also an excellent forcing variety, good for growing in frames or any chance places where there is a little room to be filled up under glass. I grew a row of it in a centre bed in a cool Peach house this year, and the quality was equally as good then as now that we are gathering from the outside rows. I have not tried it for sowing late for autumn gatherings, as for this purpose I usually rely upon Autocrat, and that very free bearing, though not first-rate sort, William I. May Queen is another good variety, and this I always grow as much of as possible. I sowed it one year in June, but it was not altogether a success, though I never had a poor crop from early sowings either outside or in. The weather lately has been very trying for Peas, cold east wind at night, and broiling sun by day, checking the plants and making them very liable to insect attacks.—H. R. RICHARDS.

— TROPEOLUM SPECIOSUM FROM SEED.—I notice in a recent number of the *Journal of Horticulture* that some of the readers have experienced a difficulty in growing the lovely scarlet *Tropeolum speciosum*. I wonder if they have tried sowing seed instead of transplanting? I know this has and does answer, and, in fact, the great secret of its luxuriance in some parts is on account of the seed germinating on the spot where it fell from the parent plants. I was amused to hear Scotland called damp, and thus supposed to favour its growth. It is some years now since I resided almost permanently in different parts of Scotland, where I am obliged to live on account of avoiding the damp of England. Should you care I would be happy to send you notes of our sufferings from drought, and of the power of the sun even in the depth of winter.—O. F. [We are very much obliged to "O. F."] We have previously heard that the best way of establishing the Flame *Tropeolum* is by sowing seeds where the plants may grow undisturbed. We have seen an example of this in Scotland, and have established the *Tropeolum* by planting fleshy roots in England, but only in a cool, moist, shaded position. Possibly the seeds should be sown as soon as ripe. We shall be glad to have further notes from our correspondent as suggested, indicating the districts in Scotland that are found to be exceptionally dry. The drought has been very serious in its effects in the south-eastern counties of England during the past few years, including the locality in which "D., Deal," has failed to establish the beautiful *Tropeolum* in question.]

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The sixtieth anniversary festival dinner of this Institution will take place on Wednesday next at the Whitehall Rooms, Hotel Métropole, at 6.30 for seven o'clock precisely, when the chair will be taken by the Right Hon. the Earl of Derby, K.G., G.C.B.

— HORTICULTURAL CLUB.—At the usual monthly dinner of the Club, on June 13th, the chair was occupied by Mr. Harry J. Veitch, Vice-Chairman of the Club. The chief business in hand was the arrangement for the dinner to be given to the distinguished foreign visitors who are expected to attend the Hybridisation Conference. The dinner will be given on Tuesday, July 11th, and the chair will be occupied by Sir J. D. T. Llewelyn, Bart., M.P., Chairman of the Club.

— THE LATE MR. T. J. SALTMARSH.—At the meeting of the Fruit Committee, of which body the late Mr. Saltmarsh was an esteemed member, held at the Drill Hall on the 13th inst., Mr. G. Bunyard proposed that a letter of condolence and sympathy be sent from that Committee to the family of the deceased. This was seconded by Mr. A. Dean, and unanimously agreed to. Mr. Saltmarsh was of late, because of weak health, a somewhat infrequent attendant at the Drill Hall, but he was ever welcomed by his colleagues when enabled to attend.

— LILAC ALBA GRANDIFLORA.—I am sending you a sprig or two of this beautiful Lilac, in the hope that the notice of it may be the means of inducing someone who has never grown it to give it a trial. It is infinitely superior in size, substance, and purity to any white variety I have seen. Unlike some of the newer varieties, it blooms quite as freely as the old well-known sorts. Dr. Lindley, rubra, and Philemon, planted at the same time, and in the same situation, are not nearly so free either in growth or bloom, although their flowers are fine; in a more congenial clime perhaps they may do better.—N. N. [The fragrant flowers were magnificent, and quite twice the size of the old-fashioned variety that our correspondent enclosed for comparison.]

— FRUIT OF COMMON ALMOND.—It may not be generally known that the green fruit of the common Almond, *Amygdalus communis*, equally with that of the Sweet Almond, *A. c. dulcis*, is excellent for tarts and for preserving; in sugar, like green Apricots. The fruit must be young, about the size of pickling Walnuts, and before the stone has formed. The crop, despite the frosts of March, is a good one this season, and may be turned to useful service, especially as Gooseberries are not over-plentiful, and as for Apricots, they seem to get scarcer every year. The Sweet Almond, like the Apricot, flowers too early, and is too tender for culture in this country as standards. But the common Almond thrives on all well drained soils, and bears freely in the southern and midland counties, appearing to like the light soils or gravels of the oolite and chalk formations. Why not cross the common Almond with Peaches, and raise a hardy race of Peaches and Nectarines?—G. ABBEY.

— MALCOLM DUNN MEMORIAL FUND.—The news of the sudden death of Mr. Malcolm Dunn, on 11th May, at Dalkeith Palace Gardens, where he had been gardener for nearly twenty-eight years, must have come upon all who knew him as a great shock. Although a gardener by profession, his interest did not end there. Horticulture, botany, and arboriculture are to-day all reaping the benefit of his great energy and devotion. Looking to this general interest displayed by Mr. Dunn, it has been agreed upon by the Royal Caledonian Horticultural Society, the Botanical Society of Edinburgh, the Royal Scottish Arboricultural Society, and the Scottish Horticultural Association, with all of which he was intimately identified, to unite in issuing a joint appeal to the many friends of Mr. Dunn throughout England, Scotland, and Ireland for funds to perpetuate his memory; and it is proposed that, after erecting a suitable monument in Dalkeith Cemetery, the balance should be devoted to charitable and educational objects in connection with horticulture and arboriculture. In issuing this appeal, the Councils of the four societies feel assured that there are very many who will gladly join in raising such a memorial as is proposed, and thus testify to their appreciation of Mr. Dunn's worth, and to the kindly help and advice which he so freely gave. Subscriptions will be received and acknowledged by any of the undersigned. In name of the respective Societies, P. Murray Thomson, Secretary, Royal Caledonian Horticultural Society, 5, York Place, Edinburgh; James A. Terras, Assistant-Secretary, Botanical Society of Edinburgh, 21, Teviot Place, Edinburgh; Robert Galloway, Secretary, Royal Scottish Arboricultural Society, 5, St. Andrew Square, Edinburgh; and Robert Laird, Secretary, Scottish Horticultural Association, 17, Frederick Street, Edinburgh. [We publish the above from a circular that is being distributed this week, and the object of it cannot but receive the sympathy and support of Mr. Dunn's many friends.]

METEOROLOGICAL OBSERVATIONS AT CHISWICK.

The weather has been generally dull, with drying winds from the north and east, with very cold nights.

— THE WEATHER.—In London on Friday was the twenty-third, and in most other parts of the country the twenty-second, day without rain, the spell of drought in the metropolis having been exceeded only three times in the course of the past thirty-four years. In the spring of 1893 there was a period of thirty days without rain, in the summer of 1887 a period of twenty-five days, and in June, 1865, a period of twenty-six rainless days. During Thursday and Friday a gradual rise of temperature has taken place over England. On Wednesday the thermometer in London did not rise above 60° all day, but on Thursday it reached a maximum of 73°, while in the course of Friday it rose to 77°. Friday's temperature was, in fact, 8° above the average. Since this day, however, there has been a distinct change, as noted above.

— SENEIO DORONICUM.—Compared with such as *S. pulcher* and others, this is not a particularly strong growing plant, but it is a very free flowering and useful one. The blossoms are of that beautiful rich golden tint that is so much admired in flowers for cutting, and they last well in water. The plants do best in an open, free working soil, where they can spread out freely and make bold clumps. The plants do not grow very freely for a year or so after planting, but once well established they come away vigorously, and the quality of the flowers is distinctly good. It is easily propagated by division.—R. BURY.

— Highbury Notes.—*Begonia corallina* at the present time makes a conspicuous feature in the long corridor attached to the Orchid and other plant structures at Highbury. Nothing could be more beautiful than the effect produced by the profusion of elegant coral red inflorescence and acutely pointed oval-shaped foliage depending from the roof. I think it may be safely said that no other species of the genus can eclipse this in the combined attributes, beautiful as many of the forms may be, not even excluding the dainty *Gloire de Lorraine* or the splendid tuberous hybrids. *Apropos* of the notice by "C. H." page 490, of *Clerodendron fallax*, it may be additionally interesting to remark that on a recent call I was agreeably surprised to find a house full of my old favourite in brilliant array intermixed with a foundation of Maidenhair Ferns. Mr. Deacon informed me that the plant is much admired by Mr. Chamberlain and the members of his family, as indeed it well deserves to be. It may be added that the plant is also extensively grown by Mr. W. B. Latham at the Birmingham Botanical Gardens.—W. G.

— THE ART OF ADVERTISING.—The amount of skill that has of late years been brought to bear on advertising is enormous. On every hand may daily be seen the power of some ingenious brain directed towards the public for the benefit of some commodity valuable or otherwise. Now we have before us a book entitled "The Art of Advertising—Its History and Practice Fully Described," by Mr. W. Stead, jun., and published by Messrs. T. B. Browne, Limited, Queen Victoria Street. As this firm must be classed as one of the most successful advertising agencies in the world it may be taken for granted that its directors would choose a man of mark to write such a book. This is, indeed, the case, for the work teems with information that must be of value to every diligent student of its pages. It is admirably printed on good paper, and splendidly illustrated. All our professional readers should get a copy, for they must agree that Macaulay's lines, quoted by the author, "Advertising is to business what steam is to machinery, the grand propelling power," were never truer than they are to-day when competition is on every hand so keen.

— GARDENING APPOINTMENT.—Mr. Geo. Lilley, for the past seven years general foreman at Shipley Hall, Derby, has been appointed head gardener to H. E. Barclay, Esq., Gaddesby Hall, Leicester, commencing from July 1st.

— SHIRLEY GARDENERS' ASSOCIATION.—The monthly meeting of above Society was held at the Parish Rooms, Shirley, Southampton, on Monday the 19th inst., there being a good attendance, presided over by W. F. G. Spranger, Esq., J.P. The lecture was under the auspices of the Technical Education Committee Southampton County Council, and was given by Mr. W. Wheeler of Messrs. Hugh Low & Co.'s Nurseries, London, whose subject was a large one—namely, "Ferns and Palms," and in dealing with it he showed considerable artistic talent and resource, speaking first of the natural beauty and usefulness of Ferns, their adaptability to all situations, their comparative easiness of culture. Mr. Wheeler next gave the method of culture adopted by those who turn out vast quantities of well-grown plants year by year. Heat, moisture, watering, the use of fertilisers, and manures were in turn considered, also the insect pests, and the best means of destroying them. Then Palms came in for a share of attention, all the best kinds for decoration receiving due attention.

— FRUITING OF OAKS.—It is not generally known to the average lover of trees, though botanists are well acquainted with the fact, that some Oaks take over a year to mature the acorns. The little flower in the axils of the leaves, when the new growth is just starting, receives the pollen from the long, twine-like catkins that hang like tassels all over the branches, and then go to rest for the season. The next year when the new flowers are going through the same process, the little germs fertilised the season before take on renewed activity, and by the autumn of this second season are mature acorns. Only the section classed as white Oaks go through the whole process from fertilisation to maturity the same season. Of those that are natives of the Atlantic States are *Quercus alba*, *Q. obtusiloba*, *Q. macrocarpa*, *Q. bicolor*, *Q. Prinus*, *Q. Prinus pumila*, and the Live Oak, *Quercus virens*. All the other species take two seasons to perfect their acorns. In some seasons the male flowers, which are more susceptible to heat than the females, come to a polleniferous stage before the fruit-bearing flowers have advanced sufficiently to profit by the pollen. In these cases the crop of acorns fails for a season. And this is true of all amentaceous plants. A crop of nuts of any kind is dependent on the period of maturity of the catkins. In the more northern regions, where there are but few extra warm days in the winter season, the nut crop is more uniform in successive years.—("Meehan's Monthly.")

— A DAY AT HODSOCK PRIORY.—On Thursday last, by the kind permission of Mrs. Mellish, the beautiful gardens and grounds of Hodsock Priory were thrown open to the public at a small fee, the proceeds being in aid of the Gardeners' Royal Benevolent Institution—one which is very popular in the district, where its benefits have been largely experienced. There are at the present time 240 recipients of its benevolences, seventeen of whom were elected at the last distribution out of sixty-five applicants, and the only one locally supported—at the nomination of Mr. Mallender, the head gardener at Hodsock—was amongst the successful number. Mr. Mallender is a loyal supporter of the fund, and it was at his suggestion that Mrs. Mellish kindly threw open the grounds. Favoured by beautiful weather, there was a large attendance from all parts of the surrounding district, and altogether the visitors spent a very pleasant time. The grounds may appear brighter in the Daffodil or Lilac seasons, or in the Rose season, but still there is no lack of flowers, particularly as Hodsock is noted for its collection of the more especially hardy blooms. It is an old world kind of garden, one of those whose beauty lies rather in its variety of landscape. At every turn one comes upon something unexpected. Its geographical conformation contributes to this charm, and in its mazy meandering paths, amidst well-wooded surroundings, the visitors enjoyed its artistic irregularity to the full. The gardens are famous, and have been for many years, for their variety of Roses. Almost every new variety and many old ones are to be found here, but as the season is late they are not yet seen to advantage. The principal flowers just now are the German and Spanish Iris in the full glory of bloom, the very showy Oriental Poppy, several varieties of Pæonies, the rare Fly Orchid, and the Lady's Slipper Orchid. The arboreal beauties of a well-wooded landscape are some splendid Beech and Sycamore, and the finest specimens of the *Picea Pinsapo* anywhere in the district. The Rhododendrons alone are well worthy of a visit. The single Roses are just showing themselves, some of them very rare and beautiful, but they share in their shyness the general lateness of the season.—("Retford Times.")

— **MARRIAGE OF MR. E. T. GILMAN.**—On Wednesday, 14th inst., the marriage of Mr. E. T. Gilman with Miss E. Butters was solemnised at St. George's, Hanover Square. Mr. Gilman has for some years had charge of the gardens at Alton Towers, one of the estates of the Earl of Shrewsbury and Talbot. The ceremony was largely attended by the friends of both parties, and the reception was held, by the kindness of Mrs. Alfred Morrison, at 26, Bruton Street. Mr. and Mrs. Gilman left for Brighton in the afternoon.

— **A FAILURE AT MAIDSTONE.**—Amidst the many successes at the Royal Agricultural Society's show at Maidstone a daily paper records a failure in one section as follows:—"Kent is a great fruit county, and it was supposed that there would have been competition for the special prizes for (1) Machine for the evaporation of fruit and vegetables; (2) Carriage packages for soft fruit; (3) Ditto for hard fruit. But the offers of the Maidstone Committee do not seem to have aroused enthusiasm, for No. 1 there was no entry, upon No. 2 the Judges decided there were 'no entries worthy of merit,' and upon No. 3, 'no entries suitable for commercial purposes.'"

— **LATE BROCCOLI.**—As your correspondent, "A.," page 491, asks "If in Yorkshire there are white Broccoli well into June," I have pleasure in informing him that I am now, June 17th, cutting heads of Dicksons' June King 10 inches over perfectly solid and white, and shall go on cutting for at least another week. Last year we cut the last head of this variety on June 24th. It is a long way the latest Broccoli I know. Model, Late Queen, and others, were over with me at the end of May. It is very dwarf, perfectly hardy, tender, and mild in flavour when cooked.—**SOUTH YORKS.**

— "A." seems to think June late for Broccoli, but we are then seldom without good heads, and I have still some fine Queens left. There is nothing extraordinary in this, and any other gardener may get them easily, but as a rule in private gardens there are plenty of nice young heads of Cauliflower from hand-light or frame plants, and this being the case Broccoli is not in demand. Want of space to devote to the former is the cause of my planting more late Broccoli than I should otherwise do. I may say that far from being in a cold place, the bed devoted to Late Queen this year is a warm and sheltered one, a high bank covered with Laurels screening it from north and east winds. Had a few of the plants been pulled and laid in a cool place they would have held out at least until the end of the month.—**H. B., Suffolk.** [We have received (though misdirected) two close heads of Broccoli well enveloped in their own leaves, but no letter concerning them. They appear to have been posted in Leicestershire.]

— **WATERER'S RHODODENDRONS.**—Londoners are not likely to see in town this season a finer display of Rhododendrons than that now being made by Messrs. John Waterer & Sons in the Royal Botanic Society's gardens. There are in the collection a thousand plants, differing largely as to size and colour, and arranged with a very clear perception of artistic beauty. In form the plants are mostly standards, ranging, both in height and breadth, from a foot or two to several feet. But it is the wealth of colour that attracts. White, blush-white, ivory, pink, purple, red, scarlet, crimson, and many other tints are there, and wherever one looks there is some striking view. This is partly due to the fact that within a commodious marquise beds and banks and undulating walks have been made with an eye to effect, and that the plants have been grouped with discriminating taste. The show has been visited by the Duke of Connaught.

— **OUR HAPPY OCTOGENARIAN.**—When the subject of anti-blight cropped up in "our Journal" last spring, the prevention of mildew on Roses and Honeysuckles in my greenhouse, a number of letters on the subject arrived to me, including one from Mr. John Strange of Aldermaston, our noted amateur rosarian, asking where he could get the powder and the bellows I recommended. He was in great tribulation, being pestered with the mildew in his houses. Of course I gave him all particulars. As time passed I felt anxious to know what success had attended my instructions, so I wrote and asked him to kindly let me know. Mr. Strange "biked" over to me the day after he received my letter, and said the powder with him was a grand success, had eradicated the mildew, and he "now felt glad for three things"—the dispersion of fungoids, the annihilation of aphids, and the possession of a manure to grow his favourite flower to perfection, which he does. The new hybrid seedling Potatoes from the Fendleri, and my old International Kidney, were planted on her Majesty's birthday, and at the termination of their committal to the ground we sang "God Save the Queen."—**ROBT. FENN.**

— **POT VINES.**—I am taking nice bunches of Black Hamburg from pot Vines, the eyes having been inserted in March, 1898. Where there is room in any of the fruit houses to train a few canes of this and Foster's Seedling, they are well worth growing. The chief points to be considered are the choice of hard well-ripened wood for the eyes, careful treatment in the earlier stages, so that no check occurs to the growth, and a regular system of pinching the leader at every couple of feet, so that the canes when finished are about an equal thickness throughout. The last repotting should take place not later than the end of June, and feeding with a good fertiliser should commence as soon as the roots are through the soil. Place the young Vines outside in August, and allow them to be thoroughly ripened by the waning sun in autumn. In any warm, moist, and light house these canes may be forced, and useful Grapes produced before midsummer.—**H. R.**

LIVERPOOL NOTES.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

LANCASHIRE gardeners especially will rejoice that the Earl of Derby is to take the chair at the forthcoming festival dinner, to be held on June 28th. Lord Derby's sympathy with all charitable movements is so far-reaching, and his ability as a speaker so well known, that we feel sure he will plead the cause with no uncertain sound, and it would not be astonishing to find more support from Lancashire than has previously been forthcoming.

Already a Liverpool citizen, T. Sutton Timmis, Esq., of Cleveley, Allerton, has signified his intention of contributing £50, and no doubt other Liverpool gentlemen will follow in his steps, and so make up a most favourable sum. Mr. Timmis' sympathy is with all classes, but none more so than with gardens and gardeners, his beautiful house and grounds, with model greenhouses, stocked with the choicest plants, and so ably presided over by Mr. B. Cromwell, the respected head gardener, being kept up in the best possible manner.

It has been said that the Charity does not benefit Liverpool to any great extent, but the fact remains that many aged and distressed are waiting patiently for willing hearts and hands to come to their assistance, and we should not be surprised if Mr. R. G. Waterman—who is a life member for this district—does not send something tangible for charity's sake, apart from any benefits that might accrue.

HARDY AZALEAS.

Equally useful for forcing or planting out, these floriferous Azaleas score a decided success, for surely nothing looks more charming in a greenhouse in the spring months, or outdoors in early summer. I was privileged to see a fine collection recently, not all the mollis types, as are too often met with, but types, although smaller in flower, which give a welcome relief when used for decorative purposes. I noted the following, as they are all so well worth growing—occidentalis, rustica plena, Daviesi, Anthony Koster, and mollis sinensis.

POTATOES AND PEAS.

We are about commencing to lift our first outdoor Potatoes, and despite the fact that the tops of Harbinger were cut down once by the early frosts, it is a long way in advance as a cropper of any other early variety in the garden. The habit is so compact as to allow of any Winter Greens to be planted in between, and not at all interfere with the Potatoes. Having tried the variety, I have come to the conclusion that it wants some beating.

A fine early Pea is Indispensable, which we are now picking. In habit of growth it resembles Telephone, but is much dwarfer, growing to a height of 3 feet. The peas are large, sugary, and pods well filled—altogether an acquisition, and earlier than William Hurst.

THE WEATHER.

For the past twenty-two days we have been entirely without rain, the sun meanwhile being so hot as to cause nearly all kinds of crops to begin to feel the effects from it, and in many cases only persistent watering has kept vegetation in a healthy condition. The ground, too, has been in a sodden condition owing to so much wet and cold, followed by a baking sun; but a change has taken place, and we are now having gentle showers, and dust-laden trees look quite refreshed. The rain is all the more welcome on account of the Strawberry crop, the fruits of which were almost at a standstill, whilst aphides on Gooseberry bushes have never been seen in such numbers.

DRY WEATHER FLOWERS.

Scarcely ever have we had such a fleeting time amongst outdoor flowers, Azaleas, Rhododendrons, and other flowering shrubs exposed to the full sunshine going more rapidly than usual. Yet in spite of this we have at the present time three sorts that have done us good service—viz., the chaste and beautiful Spanish Irises planted on a dry southern bank have contained in mixture such exquisite hues as to rival any class of plants in cultivation. The Pyrethrums, too, are of the greatest importance, and have been for the past three weeks able to defy the hottest weather. I have noticed some magnificent new shades among the single varieties, and judging from the appearance of lady purchasers in the shops and markets, there is no disputing the fact as to which are held most in popular favour. The Oriental Poppies have been unusually handsome, their giant flowers and intense colouring making them worthy objects for all classes.—**R. P. R.**

ROYAL HORTICULTURAL SOCIETY.

EXHIBITION OF HYBRID PLANTS.

WE have received at the moment of going to press a budget of information relative to the Society's Examination in Horticulture, in which we observe that Mr. H. H. Eaton, County Technical School, Stafford, heads the list with 285 marks, and to the International Conference on Hybridisation to be opened at Chiswick on July 11th and concluded at the Town Hall, Westminster, on the following day, but this week we can only find space for the following particulars of the medals that have been offered.

1, A Veitch Memorial Medal to the raiser of the best new fruit intentionally raised by cross-breeding or hybridisation in Great Britain, and never previously exhibited.

2, A Veitch Memorial Medal to the raiser of the best new flower (Orchids excluded) intentionally raised by cross-breeding or hybridisation in Great Britain, and never previously exhibited.

3, A Veitch Memorial Medal to the raiser of the best new Orchid intentionally raised by cross-breeding or hybridisation in Great Britain, and never previously exhibited.

4, A Veitch Memorial Medal to the raiser of the best new vegetable intentionally raised by cross-breeding or hybridisation in Great Britain, and never previously exhibited.

5, A Veitch Memorial Medal to the raiser of the best new fruit intentionally raised by cross-breeding or hybridisation out of Great Britain, and never previously exhibited.

6, A Veitch Memorial Medal to the raiser of the best new flower (Orchids excluded) intentionally raised by cross-breeding or hybridisation out of Great Britain, and never previously exhibited.

7, A Veitch Memorial Medal to the raiser of the best new Orchid intentionally raised by cross-breeding or hybridisation out of Great Britain, and never previously exhibited.

8, A Veitch Memorial Medal to the raiser of the best new vegetable intentionally raised by cross-breeding or hybridisation out of Great Britain, and never previously exhibited.

The above medals will only be awarded should the exhibits be considered sufficiently meritorious, and the result of intentional, not accidental, cross-fertilisation.

Exhibitors must give full details in writing as to parentage, and record any other points which may assist the Judges.

9, A Williams Memorial Medal to the best collection of hybrid and cross-bred plants.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters (in the chair); Mr. Veitch, Rev. W. Wilks, Rev. C. Wolley Dod, Prof. A. H. Church, and Rev. Prof. G. Henslow, Hon. Sec.

Panax Marstersianus.—Dr. Masters exhibited a flowering spray of this plant, which probably came from New Guinea. It has never been thoroughly described hitherto, as no flowers had been seen. Dr. Masters undertook to examine them, which appeared to be all male, and report upon it.

Cattleya Mossiae.—He also exhibited a blossom of this Orchid strangely malformed, which he also undertook to examine.

Lilac with central (terminal) bud aborted.—He brought sprays to show the presence of this bud lying between two opposite fully formed buds. It is said to be always aborted by frost; but as it is invariably the case, it would be more likely to be atrophied, in consequence of all the nourishment being conveyed into the two opposite buds.

Hemerocallis leaf diseased.—Dr. Smith reports as follows upon leaves sent to the last meeting:—"The reddish spots on leaf sent are caused by a fungus. Each spot is $\frac{1}{4}$ to $\frac{1}{2}$ -inch diameter, and consists of a patch of cavities (pycnidia) sunk in the leaf tissue. From these tiny conidia are given off to disperse the fungus. In addition to the internal pycnidia, another form of pycnidium is formed on the surface, when a portion of the leaf with spots is kept in a moist chamber; these latter also give off tiny conidia. The forms of pycnidium and their structure refer the fungus to the genus *Asteroma*. Farlow, in his 'Host Index for U.S. America,' gives a form *Asteroma Lineola*, the pycnidial stage of *Dothidea Lineola*. The ascospore or *Dothidea* stage is not present, as far as I can see, on leaf sent."

Diseased Peach.—The following is also Dr. W. G. Smith's report:—"The fruit sent showed a large patch of fungus mycelium with conidia. Two forms of conidia occurred, by which the rot might be referred either to black spot disease (*Cladosporium carpophilum*) or the fruit rot (*Monilia fructigena*). In transit the fungus spot appears to have enlarged enormously, and it looked quite unlike what one generally sees in either of the above Peach diseases. In any case it is a distinct fruit rot, and controllable by spraying methods."

Peridermium Plowrighti (Kleb).—The following communication was received from Dr. Plowright, with illustrative specimens:—"The specimens of *Peridermium* sent herewith were produced by artificial culture, and afford an illustration of how easy a matter it is to unravel a mystery when one once has the clue to it. It is just twenty-five years ago since Wolff showed that *Coleosporium senecionis* was connected with *Peridermium pini* on *Pinus sylvestris*. This *Peridermium* is frequent upon the Fir trees near King's Lynn, so that I had ample opportunity of confirming Wolff's observations. As a matter of fact, between the years 1881 and 1888, on ten separate and distinct occasions, I did apply the spores of *Peridermium pini* to *Senecio vulgaris*. Once, and once only, did I succeed in producing the uredo on the last named plant. My non-

success I attributed to some error in manipulation, and as I was engaged with other species I did not follow the research up. Dr. Klebahn of Hamburg, however, set about the problem, and soon cleared the matter up. He showed that the *Coleosporia* as a genus had their aecidiospores on *Pinus sylvestris*, and not *C. senecionis* alone. The species on *Tussilago Farfara*, which is exceedingly common all over England, was one of the forms to which Dr. Klebahn directed his attention, and he gave the above name to its aecidiospores. The specimens sent herewith were produced by artificial culture. On October 16th, 1898, a leaf of Colts-foot, with the teliospores of *Colcosporium tussilaginis* abundantly upon it, was fastened upon young *Pinus sylvestris*; on February 20th suspicious spots began to show, but it was [not] until April 22nd that an abundant development of the *Peridermium* was observed. On that date the Colts-foot leaf was still attached to the Fir, and the most abundant development of *Peridermium* was seen to be immediately beneath it. As this experiment was performed some three miles from my house the plants were not visited so often as they otherwise would have been. On April 25th two young plants of *Tussilago Farfara* were infected with the above aecidiospores, and on May 13th each was found to be abundantly affected with the uredo of *Coleosporium tussilaginis*; they were gathered, and are also sent herewith. I have to thank Mr. Walter Scott of the Golden Ball Nurseries for the material employed in these cultures, and Mr. Rodgers for his assistance in looking after the plants."

EXPERIMENT No. 1243.—*Colcosporium tussilaginis* placed on a young plant of *Pinus sylvestris* (infecting): Material wired on to the tree 16th October, 1898; *Spermogonia* observed 20th February. *Peridermium Plowrighti* abundantly produced and fully developed 22nd April, 1898.

EXPERIMENTS 1264-1265.—Two young plants of *Tussilago Farfara* infected on 25th April, 1899, with aecidiospores of *Peridermium Plowrighti* from Experiment 1243, perfect uredo gathered 15th May.

HARDY FRUITS AND "PLOWING."

AFTER your kindly notice of my little pamphlet upon the above subject, I feel that it would be unkind on my part if I set in motion the law of libel. Steal, Sir, no, I trust I have not descended to that level! The mere accusation would be enough to give me a sleepless night, were it not that a good conscience (on this point) sustains me. I might say a good deal in reply, but no doubt many of your readers will have discovered, like myself, that wide and deep as your reading has been, and infallible as an Editor of course is, there is one good old book on farming which you have not studied as deeply as you might have done.

The book in question is not only the best in the English language, but the oldest and one of the highest authorities on orthography, and yet I find—amongst many other sayings upon plows, plowing and plowmen—the following, "The sluggard will not plow by reason of the cold," "Doth the plowman plow all day to sow?" "The plowman shall overtake the reaper," and so on. Mr. Editor, I need not tell you the name of the book, your active mind will long since have grasped the situation, and have by this time found out a graceful way of "climbing down" (now this is stealing from our American cousins).

I shall not give you the exact references to find the quotations given above, for in searching for them you will, I am sure, find much that is instructive, and if you discover nothing else you will find that many so-called Americanisms are simply the good old English of our forefathers, carried over by the pilgrim fathers and retained, whilst we have changed our spelling and pronunciation. Mr. Editor, we are both Midlanders, "dog does not eat dog," and having vindicated myself from the charge of theft, I am willing to bury the hatchet. I know you will print this (though I could not say the same of all Editors), so until next week I must try to possess my soul in patience.—A. H. PEARSON.

[Yes, certainly, we print it with pleasure. It is just the sort of light reading that acts as a counterpoise to the heavy matter that so largely abounds, and the sparkles of literary morality are especially welcome as coming from the pen of he who introduced the now famous line, "He writeth best who stealeth best," and who even confesses to a little "stealing" now, for the italics in the above proof sentence are his own.

It is not necessary to refer to the Biblical citations. They are admitted, and our friend is congratulated accordingly. We believe there is much truth in the proposition that many so-called new American words are old English exportations. We can well remember some of them in common use by the old folk along the east coast half a century ago, but now practically obsolete at home. They may have travelled westwards into the Midlands, even as far as Chilwell. Wisdom is always supposed to have come from the East. The Editor is not a "Midlander," and would "rather" like to draw his acute and genial correspondent again.]

MELONS.—Up to the present time this year no Melon, old or new, seems to have shown, so far as quality is concerned, good flavour. The fruits of Hero of Lockinge and William Tillery, both first-class old varieties, shown recently, and perfect in production, both lacked flavour, yet there has been no lack of sunshine. New varieties also so far have met with no approval. We have no such uncertain fruits as Melons. It is possible some good ones will crop up later, but the Melon season to obtain high class flavour seems to be a short one. It is doubtless intensely disappointing to those who send fruits up to the Drill Hall that look so delicious and tempting, to learn that they are after all devoid of flavour. I fear the Committee are often regarded as incapable of appreciating excellence. Possibly flavour escapes in transit.—A. D.

LÆLIA PURPURATA ANNIE LOUISE.

THOUGH *Lælia purpurata* is undoubtedly one of the handsomest and most popular Orchids in cultivation, it cannot be said that the number of varieties of the highest quality is very great. Now and again we have one of much above the average merit, and when such is the case, it is hailed with pleasure by all orchidists. Such a one is *L. p. Annie Louise*, which was exhibited at the recent Temple Show by G. W. Law Schofield, Esq., Rawtenstall, Manchester, when a first-class certificate was recommended by the Orchid Committee of the Royal Horticultural Society. It is a noble flower. The sepals are very soft rose, and the broad, slightly wavy petals deeper rose, with bright crimson veinings, and a paler base. The superb lip is rich crimson, deepening towards the throat and side lobes. A flower of this form is depicted in the woodcut, fig. 113.

EPIPHRONITIS VEITCHI.

THIS is one of the finest hybrid Orchids (fig. 112) in existence, and, fortunately, it is so easy to grow and so freely propagated, that already

FIG. 112.—EPIPHRONITIS VEITCHI.

it has found its way into many collections which, in the near future, it will doubtless be much more grown. Beautiful bright scarlet blossoms, that last for weeks in perfect order on a plant of singularly graceful habit, are the result of this, one of the most successful crosses ever made. Its parents are *Epidendrum radicans* and *Sophrontitis grandiflora*, and it was raised in Messrs. Veitch's nursery about ten years ago. It thrives well in rather small baskets or pots in a shady part of the Cattleya house.

DENDROBIUM WARDIANUM ALBUM.

The flowers of the true albino of *D. Wardianum* are quite distinct from a form called by some *D. Wardianum candidum*, in which the sepals and petals are pure white, having lost the rosy purple tips, but not the maroon blotches at the base of the lip. The only tint of colour in the true form is a yellow blotch in the centre of the lip, and by this our correspondent can tell whether or not his is the true form. At one of the earlier meetings of the Royal Horticultural Society this year many grand forms of this fine Orchid were shown, among them being a plant of each of those mentioned above. There is not the least doubt about their distinctness.

DENDROBIUM FALCONERI GIGANTEUM.

There is a very close affinity between *D. Falconeri* and *D. Wardianum*, as is shown by this form, which is almost exactly like the older Assam form—really the type from a botanical point of view—of this popular species. The colouring is very beautiful, much brighter than that of the long-stemmed Burmese form of *D. Wardianum*, yet distinct from *D. Falconeri*, which has also shorter pseudo-bulbs. It is rather a difficult plant to grow, the slender stems having less staying power

than the larger ones, and unless considerable care is exercised the young growths are apt to damp badly in spring. Small pots or pans and very little compost are necessary.

THUNIA MARSHALLIANA.

This fine Orchid has done grandly this year, producing fine elegant racemes with nine and ten flowers on each, and every stem has its flower spike. There is no doubt that ample sunlight suits this plant exactly. It will grow and flower freely when the sun shines full on the plants, and the atmosphere is loaded with moisture; but in a dark or shady house, stems a couple of yards in length will be produced without a sign of bloom. The compost should consist of good loam, peat, and moss, and it is usual to repot annually.

THE ATMOSPHERE OF ORCHID HOUSES.

In creating a suitable atmosphere for the growth of Orchids, ventilation, damping, and the supply of ammonia to the air have all to be considered. It is necessary so to balance the elements that one does not preponderate, so to speak, over either of the others. Anyone with a little experience will know how difficult this becomes at times, especially during capricious weather, and when a cold wind is blowing under a bright sun. The careless grower, as a rule, drops his blinds, takes off most of the air, and leaves the plants to take care of themselves as best they may.

The grower who studies the needs of his plants knows that by doing so he would be depriving them of much needed light and air, both being as necessary to the growth of most Orchids as it is to that of a Vine. So by frequent attention he keeps the air constantly changing, yet always correct, and never lowers the shading earlier than is absolutely necessary to protect his plants from the rays of the sun. Needless to say the latter is the more successful, and in this I do not wish to be taken as advising anyone to be constantly running to the blinds and ventilators, but by careful and judicious manipulation of both to strike the proper balance between a close, moist, and shady house on the one hand, and on the other an arid and draughty one with the foliage scorching.

With regard to the supply of ammonia to the atmosphere this is a phase of culture not sufficiently practised, especially with the epiphytal division, that practically live on what that they derive from the atmosphere. There are various methods of supplying this element, and one of the most satisfactory is sprinkling about under the stage a mixture of dry soot and lime in equal proportions. This is only practicable in certain cases, of course, but where possible it is a great aid, the constant and moderate supply caused by the dripping of the water on the soot and lime being just what is needed.

Where any objections are raised to this method recourse may be had to sulphate or carbonate of ammonia, dissolving either of these in water and using it for damping. A little of the former may be put in the evaporating troughs with a good effect. Damping itself is rather under than overdone. If Orchids were watered less at the roots and more through the atmosphere, we should have healthier plants without a doubt. Regarding the admission of air so much depends on circumstances that nothing like definite instructions can be laid down, but I would like to warn readers against the unpractical theorists who advise nailing down the top lights and other methods. Top ventilation should never be overdone, but in its place is very useful.—H. R. R.

AN AMATEUR'S GREENHOUSE.—No. 2.

WHEN I gave the account of the contents of my little greenhouse in what I may call its spring aspect, I said that of course very soon that would be all changed; the bulbs which had mainly contributed to its adornment would be passed, and many of them, such as the Freesias, having been thoroughly baked, would be laid aside for another season. But I said, also, that other plants were in progress to take their place. Of course, where the means at the disposal of owners are much greater than mine, this is a matter of no difficulty; not so where there is but the one house with its small annexe, and yet I think anyone coming into it now, with its overflowing wealth of bloom, will almost think that I have been drawing the long bow when I said that the plants to fill it up were all grown in the one house.

PELARGONIUMS.

They mainly consist of Pelargoniums, which are during the winter in 48-inch pots, and placed on the shelves near the glass. In the month of February these were repotted, mostly in 24-inch pots, and in a compost consisting of loam, old cow manure, well decayed leaf mould, and a little sand. These were either returned to shelves, where they wintered, or placed in the back part of the staging until they began to grow well, and were then afforded a more prominent position. The Pelargoniums belong to the Show and Decorative section, with a few Zonals. I need hardly say that the Show varieties are not so much in evidence as they used to be fifty years ago. We

do not now see the wonderful plants which Mr. Turner of Slough and Mr. Bailey of Shardeloes used to bring to our metropolitan exhibitions: they were marvels of growth and of excellent culture, but there can be no doubt that they had a stiff and formal appearance, and they had to be supported by a forest of sticks, but it was ever to me a matter of wonder how exactly they were all timed to flower at the same moment. Six of these plants would fill a large-sized greenhouse, and the fortunate owner of the plants might take his friends to see and admire them, but not a bloom dare he pluck to give his friend a souvenir of his visit.

In those days, beside the Show Pelargonium, was a class called "Fancies," specimens of which we rarely see nowadays; the foliage of the plants is smaller and neater than that of the Show varieties, and the flowers are also of a different character; moreover, they require a warmer house, and hence it is, I think, they are not so popular, and for one person who grows Fancies, twenty would grow the Show varieties. I never attempted their growth myself, because I could not keep my house sufficiently warm—at least, if I did so, it would be to the detriment of its other inmates. I confine myself, therefore, to the Show and Decorative varieties, and I think perhaps there is an undue preponderance of the latter. I have a strong affection for the former, as they bring to my mind many a pleasant day spent with the late Mr. Hoyle of Reading, and Mr. Charles Turner of Slough. One visit to the former I particularly recollect; he was one of the three who did so much to improve the Show varieties, the other two being Mr. Foster and the Rev. J. Garth. He had taken the trouble to gum into a book petals of some of the flowers of each year, and it was most interesting to see their gradual development from narrow pointed petals to the round and beautifully formed flowers of later years, evidencing what the skill and perseverance of the hybridiser could effect. They could not keep up their popularity, and when what were called by some the Regal Pelargoniums came to the front, the Show varieties had to take a back seat. Some of these came from the Continent, and many from our home raisers, amongst whom were Messrs. Henderson and Bull. These are of a very showy description, and carry large trusses of finely marked and well shaped flowers.

LILIUMS.

Going into my greenhouse now I do not find such a variety as in the earlier filling of the house, but still something worth noticing, and a great quantity of flower. At the far end there are three stately plants of *Lilium Harrisii*, now covered with the beautiful bell-shaped pure white flower. This curious freak of Nature (for one must so regard it) is unsatisfactory in one point, it is essentially an annual—what I mean is, that you cannot place any reliance on it the second year after importation; in fact, when I have turned them out into the open ground, hoping that they might revert to the old longiflorum type, they have mostly perished altogether. Besides these Lilies, I have some of the more recent additions. There is one, however, in which I have been grievously disappointed—namely, *Lilium Dal-Hansoni*. This is a hybrid between the dark Martagon *Lilium dalmaticum* and *Lilium Hansoni*. It was raised by Mr. Powell, of Southboro', Tonbridge Wells. I obtained a bulb of it this year, which grew well, and developed a good head of bloom buds, much after the manner of *Hansoni*, but to my great disappointment they never expanded; why I do not know, except that when I received the bulb it had made a shoot of about 8 inches long, and probably the repotting which was necessary may have given it a check; the plant looks healthy, but alas! it has disappointed me this year.

Another Lily of recent introduction which we owe to the enterprising firm of Wallace & Co. of Colchester, is *Lilium rubellum*. It is of somewhat small growth, and is not more than 18 inches high; it is of a beautiful pink or rose colour, and has a delicate perfume. It received a first-class certificate from the R.H.S., and is perfectly hardy, reasonable in price, and will, no doubt, ere long,

find its way into the gardens of all lovers of hardy herbaceous plants and roots.

I have also some of the very beautiful *Calochorti* or Maiposa Lily, or Butterfly Tulip as it is variously called. Mine are of the Eldorado type, imported by Messrs. Wallace & Co. They seem to be of a more robust character than those previously received, and are certainly very quaint and beautiful. I find them perfectly hardy, although perhaps their beauty is likely to be damaged by the severe weather we sometimes experience when they are in flower. I have some plants of *Primula obconica*; that everlasting bloomer. I have never experienced any injurious effects from handling it, although I cannot question the fact that it does irritate the skin of some people; indeed a lady who called on me the other day, and who is a great lover of flowers, told me she could not stay in the room where there was a plant of it. Whether this was the result of imagination or not I cannot say, I only record the fact.

FIG. 113.—*LÆLIA PURPURATA ANNIE LOUISE*.

GLADIOLI AND SCHIZANTHUS.

As a lover of bulbs I could not at this season of the year be without some pots of the dwarf early blooming Gladioli, especially of that delightful form of *Colvilli* which we grow under the name of The Bride; these are now fully in flower, and form a pleasing variety. There is one variety of *Schizanthus* still in flower, *S. retusus*, which I consider the showiest of them all; it is dwarfer in habit, comes later into flower, and is very brilliant. It appears also to be somewhat more delicate, for I get few plants from the packet of seeds that I sow, while the other varieties come up plentifully. I have about four dozen plants of Pelargoniums, and amongst them a few of the curious *echinatum* variety; this, with its sharp spines, is always a puzzle to visitors, who hardly expect to find a "Geranium" with thorns. The flowers are small but very pretty, and as they are borne on long stems they are very good for cutting.

DISAS.

There are two or three plants which always occupy a cherished position in my small house, which are not yet in flower. These are *Disa grandiflora*, and this year *Disa Veitchii*; the former I have grown off and on for five-and-thirty years, sometimes being very successful

with it, and at other times quite failing. Why, I do not know, because I have always adopted the same treatment, but I am afraid it is one of those plants about which there is no certainty. As it seeds freely many seedlings are offered for sale, but as a rule I do not think they are equal to the type in the brilliancy of their colouring or compactness of their habit. There are some places where it has been grown most successfully. I may instance the Cambridge Botanic Gardens, and The Briars, Reigate, while on the other hand I know some of our largest Orchid growers have quite failed to keep it. My plants now look well and seem likely to flower splendidly.

My stages are now completely full, and it may be perhaps asked, What will be the condition of your house when these are removed? Will the stages not be bare? Well, I hope not. On the shelves above I have a fair supply of *Streptocarpus*, which I hope will then make a fair show, while in my annexe I have a number of *Begonias*, double and single, which will no doubt take the place of the *Pelargoniums*.

GREEN FLY.

Of course, as I have already said, I cannot claim all the credit in this success; the plants of *Pelargoniums* which my gardener has produced this year seem to me models of good culture. There is one thing about which we are very particular, that is not to allow aphides to bother us. We can now avoid the nastiness of tobacco smoking by using Macdonald's fumers, which do the work effectively.

I have still a couple of plants of *Calla compacta nana* in flower, but I should not mention them save for the reference which was made in last week's Journal to my request for information about *Calla Pentlandi* and *Elliottiana*, which I regret to say confirms my suspicion that I have not sufficient heat to grow them successfully. Mine is not an intermediate but a cool house, and I thus must give up all hope of growing it. It is most thankless work when time and labour are expended upon plants which, although they may keep alive, have yet no prospect of flowering.—D., *Devil*.

THE VINE IN AUSTRALIA.

IN the course of a paper read before the Australasian Association for the Advancement of Science, Mr. F. B. Kyngdon stated that the first Grape Vine in Australia was planted at Castle Hill, near Sydney, in 1791, by Colonel de la Campe, a French emigré. The first Grape Vine near Parramatta, a few miles from Sydney, and famous for its orangeries, was planted in 1801. After the fall of Napoleon, in 1815, Mr. John Macarthur, a spirited colonist, while in Europe obtained a number of cuttings of the finer varieties of Vine, but the nurseryman to whom they were entrusted for despatch to Sydney, substituted others of an inferior kind. The trick was not discovered until several years afterwards, the soil and climate of the colony being in the meantime blamed for the failure of the experiment.

In 1825 cuttings of the Muscat and Madeira varieties were sent to Sydney, and thrived splendidly. Other cuttings followed, but the British Government refused to grant passages to Continental Vine-dressers, and it was not until 1844 that such men found their way into the colony. Thenceforward the progress of Vine cultivation was rapid, and with its increasing spread the production of wine became a recognised industry. In 1861 there were in New South Wales, Queensland, South Australia, Victoria, and Western Australia 7009 acres under Vine cultivation; in 1896 the area had become increased to 58,642 acres, the product being 5,606,035 gallons of wine, 7901 gallons of brandy, 63,665,280 lbs. of table Grapes, and 2,145,360 lbs. of raisins.

The Grapes grown in New South Wales are equal in size and flavour to the finest grown in Continental Europe, but both their cultivation and the production of wine from them remain imperfectly developed as a whole. In 1897 the area under wine cultivation in the colony was 8061 acres, producing 794,256 gallons of wine, 7134 gallons of brandy, and 6,462,400 lbs. of table Grapes. The raisin manufacture is still one of the industries of the future in New South Wales. In 1893, with 462 acres less under cultivation than in 1897, the quantity of wine produced was 931,542 gallons.

Most of the vineyards are of limited extent, but several are of large size. They are scattered over the whole of the colony, save on the more elevated table-lands and in the sub-tropical regions. There are over 2000 vigneron in the colony, the most successful being Italians, Germans, and Frenchmen, or individuals having some practical knowledge of Vine cultivation as practised in Europe. The colony offers an unlimited field for enterprise in this direction, there being many thousands of acres eminently adapted for Vine cultivation remaining unutilised.

It has been stated by a leading authority that New South Wales is more favourably situated for raisin production than is any of the other colonies, and that when the industry has become introduced and firmly established a large intercolonial and export trade may reasonably be anticipated. Of the 16,695,560 gallons of wine imported into Great Britain in 1896 only 6394 gallons were from New South Wales, most of that produced in the colony being locally consumed. Such is the abundance of Grapes, mostly the black varieties, in the colony, that during the season they are retailed at 1d. per lb. in Sydney, the finest Muscatels bringing from 3d. to 6d. per lb. In the vicinity of the vineyards they are cheaper still.—J. PLUMMER, *Sydney, N.S.W.*

FERNS OUT OF DOORS.

WHERE Ferns grow and flourish the air in the autumn is full of their spores, which are carried about by the currents until they settle. I have known Ferns come up in the hollows of trees, on walls that happened to be damp through the leakage of a water-trough or other cause, on the walls of a cellar, or on the floor of a greenhouse, and where they once make a start in that way they thrive according to the nourishment they receive. In some instances where this has been very limited, they live on for years without increasing in size. But this is not exactly what the cultivator wants, for they are grown for ornament, and that consists in the full development of the fronds.

The position and climate have an influence in a certain degree on the well-doing of the Ferns, as they do better in some parts of the country than in others; but, generally speaking, there are sorts adapted for almost every part, and there are few places where a fernery might not be established and the Ferns made to flourish. As far as I have seen the cause of failure to do so may be traced more to the management than to anything else.

Unless on a large scale, it is not advisable to attempt to grow Ferns alone, but to associate them with American trailing, and alpine plants; and although the Ferns may form the principal feature, yet the addition of other plants will give the fernery a more interesting character. Where it is desired to make a small fernery, it will be well to exclude the larger and coarser kinds, such as the Male Fern (*Lastrea Filix-mas*), and Lady Fern (*Athyrium Filix-femina*), although there are more diminutive varieties of both that may be advantageously introduced. *Lastrea cristata* and *dilatata*, and *Polystichum aculeatum* it would be as well to leave out, although the latter forms a noble plant; but *Polystichum angulare* and *lobatum*, with their varieties, look as well and do not grow so large. Any of the varieties of Hart's-tongue (*Scolopendrium*) may be well introduced, also several varieties of *Polypodium*, such as *dryopteris*, *phlegopteris*, *calcareum*, *cambricum*, and *vulgaris*, the two latter being evergreen, the others dying down in the autumn. The Scaly Hart's-tongue, *Ceterach officinarum*, make a very pretty Fern when it does well, which it will do if not interfered with by other plants, and is planted in sandy peat and has plenty of room. *Aspleniums Trichomanes viridis*, *ruta-muraria*, *septentrionale*, *alternifolium*, and *fontanum*, are all of very diminutive habit, but make pretty little tufts when they thrive, which is not always the case, as I have known them fail to do so very frequently. They should have a good depth of sandy peat and loam, be well drained, and have plenty of room, so as not to be overgrown by other plants. They ought to be in a rather shady spot, but not under the drip of trees, and if a bell-glass be put over them in the winter they will be all the better.

Asplenium marinum and *lanceolatum* grow rather larger and sometimes do well; they may be more elevated but sheltered. *Allosorus crispus*, the Parsley Fern, makes a beautiful little tuft, but it is sometimes apt to die off unaccountably, and will be better for a little shelter in winter to protect the crown from excessive wet. *Blechnum spicant* and its varieties are very hardy and will stand any rough weather, and they sometimes make fine patches. They require a good depth of soil and may be planted low down. The Maidenhair Fern, *Adiantum capillus-Veneris*, succeeds tolerably well. *Adiantum pedatum* is also hardy to a certain extent, and is a beautiful Fern, but it dies down in winter. *Asplenium Adiantum nigrum* makes a very pretty plant, always retaining a certain freshness, and is very hardy. *Woodsia hyperborea* is a pretty little Fern, but requires protection from rain in winter. All these Ferns, and several others that I cannot call to mind just now, may be grown successfully in a small outdoor fernery; but let there be no stint of good porous soil; let each plant have plenty of room, be shaded but not covered, and have plenty of moisture in spring and summer, with good drainage. The crowns of most of them will be better if a little elevated, but not too much, as some persons are in the habit of carrying this point to the extreme.

There are several hardy Ferns which are well worth a place if room can be spared. What I have named may be grown in a very small space; but on a rather larger scale such as the following may be introduced, being larger in habit than most of the above, but less so than the Male or Female Ferns. The Ostrich Fern, *Struthiopteris germanica* and *S. pennsylvanica* are handsome species, coming up rather earlier than more strictly native Ferns, and dying down earlier. *Onoclea sensibilis* has creeping roots, which render it difficult to keep it in its proper place, but it may be surrounded with slates, which will have that effect. The same may be said of *Lastrea thelypteris*; these both require extra moisture, and may be planted near the ground line. *Lastrea rigida* makes a very handsome Fern, but where it grows freely it becomes too large for a small fernery. The same may be said of *Osmunda regalis*, although the roots may be kept within certain limits, which will prevent the plant growing too large. They require plenty of moisture. *Cystopteris alpina*, *fragilis*, and *montana* are suitable for a small fernery, and should have been mentioned in connection with *Polypodiums*.

Hymenophyllum tunbridgeense and *Wilsoni* may sometimes be seen doing very well out of doors when protected with a bell-glass, but I cannot say that I ever saw them in such a satisfactory state as I should like; however, I once saw a mass of the former in splendid condition in a small greenhouse, where no fire heat was ever applied, it having stood all the frost that ever entered there. I have grown both these and the *Trichomanes* very fine under a bell-glass in a greenhouse. The bell-glass seems necessary for the latter, and for both when grown out of doors. They grow well in equal portions of silver sand and peat, with plenty of pieces of sandstone broken up and intermixed.—F. C.

SPRAYING AND SPRAYERS.

For distributing liquid insecticides economically and effectively no method is equal to that of the spray. By a suitable appliance the liquid is broken up into myriads of minute globules, which rest like dew on plants and their pests alike. In this form it acts more powerfully against many parasites than if five or ten times the quantity were applied with the ordinary syringe, most of it to run off and be wasted on the ground, if nothing worse, or on the soil of plants in pots.

Various forms of excellent spraying apparatus are in use fixed on wheels and moved by hand or horse power according to circumstances. There are also, as numbers of persons know to their satisfaction, the handy and serviceable knapsack sprayers, as well as small pumps fixed in pails. All have their appropriate uses; but few, if any of them, meet the circumstances of numbers of persons in comparatively small private gardens. True, small hand sprayers have been invented, some of them very diminutive; but all the same a thoroughly sound,

Fig. 114.

durable, and efficient appliance, to be used like a syringe, has long been required by amateurs and gardeners alike.

Calling at the South-Eastern Agricultural College at Wye a few weeks ago we found Professor Percival in a jubilant mood. With a shout of Eureka he lured us into his garden. It was thought perhaps he had discovered another new fungus or eelworm which he was going to display under a forty-thousand power microscope, or something of that kind; but it was something very different, visible to the naked eye, tangible and substantial.

Taking a syringe out of a pail of water we were the next moment enveloped in a cloud of mist. Nothing cared he for hats or clothes, and another mist was produced, with the comforting assurance amidst the drizzle, "Oh, never mind, it won't hurt you; did you ever see a more beautiful spray? I tell you it's the best thing I have found, and all complete for nine and six; here, take it, try it, examine it inside and out." This was done, and to the question, "Did you ever see anything better?" we were constrained to reply, "No, never; but where did you find it?" The answer was "Good; you have not come to Wye for nothing. I had it from Mr. White of Paddock Wood, the great Hop and fruit grower; he uses bigger things himself and has invented this for everybody. Eureka." Exit Professor Percival.

Messrs. E. A. White & Co., Ltd., have in their own interests been making experiments for a long time with the object of abolishing insects. As a result they used with much success and distributed a Hop and fruit tree preparation called "Spimo." This we had tried last year. It cleansed fruit trees of aphides of all kinds that infested them, killing most of them at a touch, checked mildew, crippled red spider, and when applied with a brush cleared away American blight. The verdict of the operator was, "Excellent stuff for orchards, but not over-pleasant to use, or suitable for greenhouse work, as apart from the smell it affects the paint."

The drawbacks referred to have now been abolished, while insects are equally abolished by another preparation, and because of this it has been shortly named "Abol," as presumably signifying abolisher. This we have now under trial, and can testify that it is not in the least unpleasant to use, in fact the operator washed his hands in it as in soapy water, which the mixture resembles at one to two parts to 100 parts water, and went forthwith to dinner.

The mixture left no stain on white greenhouse paint, or on leaf or flower; indeed, it left nothing behind it but dead insects. All that were reached were killed, even the persistent *Aphis mali* and its attendant—ants. Swarms of caterpillars of the small ermine moth quickly succumbed, but their web protector sheltered them from the spray, and the syringe nozzle had to be used to break the nets.

Similar remarks apply to the American blight; when the "wool" was broken through they were dead in a moment. Neither thrips nor red spider could be discovered, but all insects that could be found were abolished. The roots of tender seedlings to which it was applied were not injured. "Queer stuff," remarked the operator, "it seems to know what it ought not to hurt as well as what we want to kill."

The small measure sent with each tin is handy. One measure to a gallon of rain water brings a lather, but quite half as much more is requisite for making hard water soft and bringing the requisite lather, which seems to be the test for insect-killing strength. The solution was passed, with the exceptions stated, through the

spray nozzle of the Abol syringe, and a little seemed to go a very long way.

A word about this appliance. It is brass, strong, and well finished, with a drip protector on the barrel and a screw-like plug in the nozzle, with two spiral grooves cut across the "worms" of the screw. The outlets of the grooves are opposite each other at the nozzle, and there occurs what may be called a fight of insect-poisoning water, for the two whirling streams come into violent contact, and are cut up into molecules innumerable, and hence the spray, finer and more abundant than shown in fig. 114.

There seems no chance of the metal plug water-divider getting out of order, and we found no clogging. If a strong single jet is wanted take out the plug; if several small straight jets are desired put on the side nozzle; but the plug is the thing for a spray and making the most of the liquid.

For spraying the under sides of leaves of plants near the ground, fruit bushes, Roses, or the lower parts of espalier or wall trees unscrew the nozzle, put on the head A A, fig. 115, and finish as shown, and you may soon have plants, branches, or bushes, as if enveloped in a cloud of smoke by the fineness and number of the liquid particles; these are blown about by the wind, and the spraying is consequently best done on a still day.

We draw attention to this useful, not to say necessary, garden appliance, because we believe it to be good, and we shall be a little surprised if it does not in time to come be regarded as a staple requisite by gardeners and amateurs over the length and breadth of the land.

If Messrs. White can succeed in producing a complete red spider and mildew abolisher—an Abol No. 2, equally handy and pleasant to use as Abol No. 1, "Spimo" can be

Fig. 115.

relegated to Hop gardens or orchards, and there possibly end its days. It is said that the Paddock Wood firm uses 1,000,000 gallons of insecticides yearly in its extensive plantations, so the managers are not without experience in the matter, or lacking in opportunities for experimentation.

PRUNING EARLY PEACH TREES.

As soon as the fruit is taken from the early trees careful cultivators will lose no time in removing all the fruiting wood that can be spared, thus allowing the reserved shoot for fruiting next season ample air and light. There are times when it is advisable to leave a little of this wood in. For instance, where there is a thin place in the tree, and the wood that has fruited has some good fruit spurs upon it, the retention of these prevents a bare spot, and though these spurs are not liked by the very orthodox Peach and Nectarine growers, the fact remains that on some of the early kinds that are very much addicted to bud dropping these spurs will often carry their fruit to perfection when the buds drop in other parts of the tree.

Though I am far from advising a system of late growth for this class of Peaches, there are times when a little additional growth is necessary, for it must not be forgotten that these open their buds at the same time as later kinds in the same house. It is in the time of laying on the flesh that they get the advantage, so a week or two longer growth after the fruit is gathered is a help rather than not. Over-ripening is a bad thing, of course, but there is such a thing as a check to growth, and those who blame over-ripening for bud dropping in every case should note how often the upper parts of the trees, where nearest the glass, and therefore the best ripened portion, are often the only parts that carry a crop.—H.

DRIBLETS FROM DUBLIN.

A NEW AGRICULTURAL SCHOOL.

AFTER the lapse of nearly fifty years the wish of the late Mr. Thomas Downpatrick is verging towards realisation, that an agricultural school should be erected and maintained at his expense in the parish of Down. The new institution is to be called "The Ulster Agricultural and Dairy School and Henry Trust," and it is the first building of its kind in the northern province. As the usual legal formality is now completed, it only awaits the sanction, or rather the signature of the Lord Chancellor. Lord Dunleath, William Johnston, Esq., M.P., and John Tate, Esq., J.P., are the Trustees selected to manage the institution, and Mr. John R. McConnell is the appointed Secretary.

THE ROYAL HORTICULTURAL SOCIETY OF IRELAND.

The usual monthly meeting of the Council of the Horticultural Society was held on Tuesday afternoon, the 13th inst., at the offices, 61, Dawson

Street, Major Domville, J.P., in the chair. After the minutes of the last meeting were read and signed, the principal item of the business to be considered by the Council was the settling of the final arrangements for the forthcoming summer show; after a short discussion the pending difficulties were completely settled. The Secretary (W. H. Hillyard) submitted a list of proposed names for election as members of the Society, which was passed. The meeting was brought to a close shortly afterwards.

DUBLIN WEATHER.

A month or two ago fine weather was the popular cry, to-day the topical shout is rain, and an amble around the country shows unmistakably why the gardeners are so vehement in their outcry; drooping plants, stunted growth, and a never ceasing run to the fountain for water. But the change that has occurred seems to say that their plaint is heard, and instead of a bright sunshine we get an occasional dark cloud and a short shower, but the spell is too brief to have an appreciable effect, it scarcely moistens the leaves. Owing to the tropical heat farmers are now able to send in a large consignment of the homely tuber.—A. O'NEILL.

GRAND YORKSHIRE GALA.

THE forty-first annual exhibition took place in the Bootham Field, York, on Wednesday, June 14th. and the two following days, and was again a pronounced success, both as regards the number and the quality of the exhibits. As is now the case at all the leading exhibitions, the trade contributed very largely to the show, and the splendid collection of Acers and other hardy plants, and the Clematis and Carnations in the entrance tent were great centres of attraction.

The arrangements in connection with the staging of the plants, groups, and also the allotting of the exhibits, so as to give the whole of the tents a finished and artistic appearance, were most commendable, and very much in advance of anything previously seen at the former excellent shows at York. The Orchids, of which there was a very beautiful collection staged, were arranged down one side of the centre stage of a lofty tent, and the groups of ornamental foliaged plants for effect were placed to back up to the Orchids, and so a two-fold advantage was gained—namely, the Orchids had a charming background; and the large Palms and Tree Ferns in the groups were so arranged that they were seen to the greatest advantage. Perhaps mention might be made to support the suggestion about the ventilation of the tents, that in the middle of the day the great sun heat, combined with the powerful scents of the flowers, made the atmosphere, to ladies especially, overpowering.

On entering the field the visitors passed into a spacious tent devoted to trade exhibits, and here were staged the groups of Messrs. Fisher, Son, and Sibray. This exhibit was composed of a charming bank of hardy hybrid Rhododendrons just in their beauty, followed by a tastefully arranged group of Acers, Tree Ivies, Cornus, Vitis Coignetia, and other hardy ornamental foliaged plants. From the same firm came well coloured Crotons, and also good forms of Cattleya Mossiae and Cypripediums. This collection had a frontage of 30 yards. Next came a group of new Clematis from Messrs. Jackman & Son of Woking, and very charming they were, being quite distinct, both in the growth and flower, from the older type of Jackmanni. The most noticeable were Duchess of Albany, a charming rose-coloured variety; Sir Trevor Lawrence, bright cherry red; Countess of Onslow, Grace Darling, and Duchess of York. As they are said to be quite hardy, they will, no doubt, prove an excellent addition to the Clematis family. In the same tent Messrs. Cutbush & Son of Highgate staged a fine group of Malmaison Carnations in variety, and in the centre they had plants of Calla Elliottiana in full flower, which was greatly admired. The same firm also provided a new attraction to this show by their exhibit of clipped Yews and Box trees.

Messrs. R. Smith & Son of Worcester sent a large collection of cut herbaceous flowers and Clematis, backed up with Bamboos and other graceful plants. Messrs. Clibran & Son of Altrincham staged at the end of the Orchid and group tent a beautiful exhibit of herbaceous Calceolarias of a very dwarf type, and most freely flowered. From Langport to York is rather a far cry, and still one of the most effective collections of cut flowers was staged by Messrs. Kelway & Son of that place. The Pæonies, Gaillardias, and Pyrethrums were fine. Especially noticeable among Pæonies were Langport Queen, Princess May, Olivia Lyde, Mrs. Gwyn Lewis, and Lady Gwendolin Cecil. Mr. John Forbes of Hawick, N.B., contributed some very pleasing examples of Phloxes and Pentstemons; new varieties being Lady Brodie, a rich deep rose; Earl of Annesley, and Sir Trevor Lawrence. Messrs. J. Hill & Son of Edmonton staged a choice collection of exotic Ferns, and it was most restful for the eye to meet the cool shades of green after the glare of bloom by which the group was surrounded.

Messrs. Walshaw & Son of Scarborough staged a small group of Cannas, which contained some of the most beautiful varieties. Messrs. Dickson, Ltd., Chester, showed a group of their new Carnation Duchess Consuelo, a good clear yellow variety that is free flowering. Messrs. Laxton Bros., Bedford, exhibited fruiting plants of their Strawberries Leader and Fillbasket. All the plants were bearing well. The unique Edwardian ware from Sherwood, Nottingham, was represented by two exhibits of prettily arranged devices.

The groups were, as usual, very excellent, and first honours were again secured by Mr. C. Mee of Nottingham, whose group was a very bold arrangement, well carried out. It contained first class specimens of many

Crotons and nicely arranged Orchids. Mrs. Gurney-Pease, Darlington (gardener, Mr. J. McIntyre), was second, staging a fine group with most beautiful Orchids, but lacking the scope and finish of the first; third, Mr. W. Vause, Leamington; fourth, Messrs. Simpson & Son, Selby.

PLANTS IN POTS.

For twelve stove and greenhouse plants (Orchids excluded).—First, Mr. James Cypher, Cheltenham, who showed very excellent specimens, and was easily first; there were grand plants of Azalea Souvenir de Prince Albert, Aphelexis macrantha, Clerodendron Balfourianum, Erica ventricosa magnifica, and Cavendishiana; second, Mr. W. Vause; third, Messrs. R. Simpson & Son, who staged a grand plant of Ixora Morsei covered with bloom. Six stove or greenhouse plants.—Mr. James Cypher was again first, staging beautiful examples of Erica ventricosa alba and Bothwelliana; second, Mr. W. Vause; and third, Messrs. R. Simpson and Son. For three stove or greenhouse plants.—First, Mr. James Cypher, Cheltenham, with good Ixora javanica and Bougainvillea Sanderiana; and third, Mr. W. Vause. For a single specimen stove plant.—First, Mr. C. J. Mee, with Anthurium Scherzerianum; second, H. H. Broadley, Esq.; and third, Mrs. Gurney Pease. For a single specimen greenhouse plant in bloom.—First, Mr. James Cypher, with Aphelexis macrantha rosea; and second, H. H. Broadley, Esq.

For six ornamental fine-foliaged or variegated plants, to include two Crotons.—First, Mr. Jas. Cypher; second, Mr. W. Vause; and third, Messrs. R. Simpson & Son. Three ornamental foliage plants.—First, H. H. Broadley, Esq.; second, Mrs. Gurney Pease; and third, R. Simpson and Sons. Single specimen Azalea.—First, Mr. Jas. Cypher, who staged a beautiful plant of Holfordiana. Three Crotons, distinct.—First, R. Simpson & Son, with grand plants of Montfortiensis, Warreni and Johannis; second, Mrs. Gurney Pease; and third, E. B. Faber, Esq., Harrogate. Single specimen Croton.—First, Messrs. R. Simpson and Son. Six Coleus.—First, Rev. H. E. Bishop, Clifton, York; and second, Mrs. Maulesley. For twenty alpine and herbaceous plants.—First, Mr. S. Hardcastle, York; and second, Mr. E. W. Pannett.

In the class for six exotic Ferns.—First, Messrs. R. Simpson & Son. Single specimen exotic Fern.—First, Rev. J. Yeats, Heworth, showing a fine Adiantum Farleyense. Six hardy Ferns.—First, Mr. T. Nicholson, York; second, Mr. J. Jackson, York. Ten hardy Ferns.—First, Mr. T. Nicholson, York; second, Messrs. R. Simpson & Son.

Carnations were not in large numbers, but some good flowers were seen. For a group of Carnations in bloom, not less than 5-inch pot, other foliage plants allowed.—First, A. Wilson, Esq., Tranby Croft (gardener, Mr. Leadbetter), a very good collection, nicely arranged, and containing well-flowered plants in grand health; second, Messrs. Laing & Mather, Kelso; third, Lord Barnard, Raby Castle (gardener, Mr. Tullett). For eight table plants.—First, W. Bateman, Esq., Pannal; second, Sir J. W. Pease, Bt.; and third, Mrs. Gurney Pease.

For a group of Gloxinias in bloom for effect, 6 feet by 4 feet 6 inches.—First, Mr. J. J. Upton, Manchester, whose group was composed of very strong healthy plants, covered with flowers of a bold type; second, J. T. Hingston, Esq., York (gardener, Mr. R. McIntosh); and third, R. Lawson, Esq., York. Eight Gloxinias in bloom.—First, Mr. J. J. Upton; and second, Donald S. Mackay, Esq., York.

Roses were not so good as usual, but no doubt the absence of rain will account for the lack both of quality and quantity. For a collection of Roses in pots in bloom, grouped, other decorative plants allowed.—First, Messrs. W. Jackson & Co., Bedale; and second, Mr. H. Pybus, Monkton Moor, Ripon. Nine distinct varieties of Roses in pots.—First, Mr. H. Pybus, and second Messrs. W. Jackson & Co.

ORCHIDS.

For a table of Orchids, 10 feet by 4 feet, cut blooms allowed.—First, Mr. Jas. Cypher, whose group was beautifully arranged, and contained charming Cattleyas, Odontoglossums vexillarium and crispum, and Cypripediums, the whole making a most effective display; second, Mr. John Robson, Altrincham. Ten Orchids in bloom.—First, Mr. Jas. Cypher, who staged fine examples of Cattleya Mossiae, Odontoglossum crispum, Lælia purpurata, L. grandis tenebrosa, and L. purpurata alba among others; second, Mr. John Robson; and third, W. P. Burkinshaw, Esq., Hessle (gardener, Mr. J. T. Barker). Three Orchids in bloom.—First, W. P. Burkinshaw, Esq.; and third, H. H. Broadley, Esq. Six Orchids in bloom, new or rare.—First, T. Statter, Esq., Stand Hall; second, W. P. Burkinshaw, Esq.; and third, W. Bateman, Esq., Pannal. Single specimen Orchid in bloom.—First, Mrs. Tetley, Weetwood, Leeds (gardener, Mr. L. Eastwood), who staged a well flowered plant of Aerides Fieldingi; second, H. H. Broadley, Esq. Three Orchids in bloom, new or rare.—First, W. P. Burkinshaw, Esq.; second, T. Statter, Esq., Stand Hall. Four Orchids in bloom, distinct, amateur or gentlemen's gardeners.—First, W. P. Burkinshaw, Esq., who had Cattleya Mendeli and Cypripedium Ashburtoniae giganteum very fine.

PELARGONIUMS AND BEGONIAS.

The Yorkshire Gala without its Pelargoniums would be quite out of character; and this year no one could complain as to the beautiful display in this section. The plants almost completely filled the centre stage of a large marquee, and, as in previous years, the keenest struggle for chief honours was between the two veteran exhibitors, Mrs. Tetley, Weetwood, Leeds (gardener, Mr. Eastwood); and J. T. Hingston, Esq., York (gardener, Mr. McIntosh). In the class for twelve Show Pelargoniums, J. T. Hingston, Esq. (gardener, Mr. McIntosh), was placed first, and they were indeed a beautiful dozen. Arranged in a bank at the entrance to the tent, they were the admiration of everyone; second, Mrs. Tetley (gardener, Mr. Eastwood). For six Show Pelargoniums, Mr. Eastwood was placed

first, and Mr. McIntosh second. Three Show.—First, J. T. Hingston, Esq.; second, Mrs. Tetley. Group of not less than eight Fancy Pelargoniums.—First, Mrs. Tetley.

For twelve Zonal, Nosegay, or Hybrid Nosegay.—First, Mrs. Tetley, showing a beautiful collection; second, Mr. H. Pybus. Six Zonal, Nosegay, or Hybrid Nosegay.—First, Mrs. Tetley; second, Mr. H. Pybus. Three Zonal.—First, Mrs. Tetley. Included in this exhibit was a finely bloomed plant of Ellen Clarke. Nine double flowered Pelargoniums.—First, Mrs. Tetley; second, Messrs. R. Simpson & Son. Three double flowered Pelargoniums.—First, Messrs. R. Simpson & Son; second, Mr. J. W. Clark, Clifton. Six double Ivy-leaved.—First, Mrs. Tetley; second, Mr. H. Pybus. Three double Ivy-leaved.—Second, Mrs. Tetley.

For a group of Tuberous Begonias, with foliage plants or Ferns for effect.—First, Miss Wharton, Burton Grange, York; second, J. Bellerby, Esq., York. Group of Calceolarias.—First, J. T. Hingston, Esq.; second, Mrs. Lloyd, Lincroft, York. Eight Calceolarias, open.—First, J. T. Hingston, Esq.; second, A. Wilson, Esq. Four Calceolarias.—First, J. T. Hingston, Esq.; second, G. Potter Kirby, Esq. Six Fuchsias in flower, distinct.—First, no name; second, J. T. Hingston, Esq. Three Fuchsias.—First, no name; second, J. Bellerby, Esq. Six Liliun Harrisii.—First, A. Wilson, Esq.; second, Mrs. Tetley.

CUT FLOWERS.

Cut flowers were not up to the usual standard. For twelve Roses, single blooms, thirty-six varieties or more.—First, Mr. W. Hutchinson, Kirby Moorside, who staged Helen Keller, John Bright, C. Testout, Général Jacqueminot, Mrs. J. Laing, Madame G. Luizet, and others. Second, Messrs. J. & A. May, Bedale; and third, Mr. Geo. Mount, Canterbury. Forty-eight distinct Rose blooms.—First, Mr. Geo. Mount with Marie Verdier, Mrs. John Laing, Prince Arthur, Capt. Hayward, and Ulrich Brunner. Second, Messrs. J. & A. May. Thirty-six blooms.—First, Mr. Geo. Mount; second, Messrs. J. & A. May, Bedale. Twenty-four Roses.—First, no name; second, Mr. Geo. Mount. Eighteen blooms.—First, Mr. W. Hutchinson; second, Mr. J. Hulme, York. Twelve blooms.—First, Mr. W. Hutchinson.

Twelve bunches stove and greenhouse cut flowers (open).—First, Sir J. W. Pease, Bt.; second, J. C. Waterhouse, Esq., Macclesfield. Twelve bunches stove and greenhouse (Orchids excluded).—First, J. D. Ellis, Esq., Worksop; second, Geo. Whitehead, Esq., Deighton Grove. Twelve bunches hardy perennials.—First, J. Burrell & Co., Cambridge; second, Sir J. W. Pease, Bt. Collection of hardy cut flowers, 18 feet by 4 feet (open).—First, Messrs. Harkness & Son, Bedale, who showed a fine collection, including Liliun Harrisii, Pyrethrums, Papavers, and Geums. Second, Messrs. R. Smith & Co., Worcester.

For forty-eight Fancy Pansies.—First, Mr. Jno. Smellie, Busby, Glasgow. Twenty-four Fancy.—First, Mr. J. Smellie. Twenty-four Show.—First, Mr. John Smellie; and second, Mr. Isaac Ramsden.

FRUIT.

For a decorated table of fruit, 10 feet by 4 feet 6 inches, not to exceed fourteen dishes, not less than ten dishes and not more than two distinct varieties of a kind.—First, Sir J. W. Pease, Bart. (gardener, Mr. McIndoe). The arrangement was charming, the only flowers used being *Oncidium flexuosum* interspersed with sprays of *Heuchera sanguinea*. The quality of the fruit was excellent. The judging was by points, and out of a possible 128 points this exhibit gained 114. The exhibit included Royal Sovereign Strawberry, Brown Turkey Fig, Grosse Mignonne Peach, Best of All Melon, Foster's Seedling and Black Hamburg Grapes. Second, Earl of Harrington, Elvaston Castle (gardener, Mr. Goodacre). The quality of the fruit was good, and the flowers comprised sprays of *Odontoglossum*. A beautiful dish of Royal Sovereign Strawberry was noticed, and good Black Hamburg Grapes.

Collection of fruit, six varieties.—First, Sir J. W. Pease, Bart., with Early Rivers Nectarine, Scarlet Premier Melon, Brown Turkey Fig, three bunches Black Hamburg, three Foster's Seedling Grapes, and Grosse Mignonne Peach. Second, Lord Barnard, Raby Castle (gardener, Mr. Tullett). Four dishes fruit.—First, W. Sheepshanks, Esq., Winsley Hurst, Ripley (gardener, Mr. A. Large); second, Sir J. W. Pease, Bart.; and third, Earl of Lonsborough.

Three bunches of Black Hamburg Grapes.—First, Earl of Lonsborough, Market Weighton (gardener Mr. McPherson); second, F. B. Grotrian, Esq., Ingmanthorpe, Wetherby (gardener Mr. Murchison). Three White Grapes.—First, F. B. Grotrian, Esq., with excellent examples of Buckland Sweetwater; second, Lady Beaumont; third, Lord St. Oswald. Six Peaches.—First, Jno. Edmonds, Esq.; second, Earl of Harrington; third, J. D. Ellis, Esq. Six Nectarines.—First, Jno. Edmonds, Esq.; second, Earl of Harrington. Scarlet-fleshed Melon.—First, Viscount Rawcliffe, Blankney, Lincoln (gardener Mr. Gurney); second, W. Sheepshanks, Esq. Green-fleshed Melon.—First, Sir J. W. Pease, Bart., M.P.; second, W. H. Bathe Wrightson, Esq., Cusworth, Doncaster. White-fleshed Melon.—First, Earl of Harrington; second, Mrs. Gurney Pease, Darlington. Six Figs.—First, Lord Barnard; second, Earl of Feversham. Dish of Cherries.—First, Sir J. W. Pease, Bart., M.P. Dish of Strawberries.—First, J. D. Ellis, Esq.; second, H. Thelluson, Esq.; third, Sir J. W. Pease, Bart., M.P. Twelve Tomatoes.—First, Lady Beaumont; second Miss Webb, Newstead Abbey, Notts; third, Col. Thorpe, Coddington Hall, Newark.

THE HORTICULTURAL COLLEGE, SWANLEY.—We are informed that the Rose garden, which has been laid out under the superintendence of the Very Rev. the Dean of Rochester, will be opened by the Viscountess Falmouth on the 29th inst., at 3 P.M. Dean Hole has promised to attend.

EUTOCA VISCIDA.

THIS is the name of the plant of which "H. R. B." sends us specimens. It is a charming annual of dwarf growth, and is adapted for small beds or near the margins of borders, as otherwise the plants appear to little advantage crowded with the taller, stronger growing perennials. The Eutocas are not particular as to soil, any moderately light ordinary garden soil suiting them, and perhaps the best way to obtain plants in good condition is to sow the seeds in the borders in the autumn. The flowers (fig. 116) have very rich blue corollas, with a circular red blotch in the centre, and they are borne in curved racemes, several blooms being open at one time. The leaves are somewhat heart-shaped, but irregularly cut at the margin, and the surface of the plant generally is covered with hairs, the points of which each bear a viscid secretion, and

FIG. 116.—EUTOCA VISCIDA.

to this character it owes its specific name. The bright blue tint is very pleasing, and the flowers, moreover, last a considerable time if cut with a good length of stem and placed in water, thus rendering them valuable for vases.

BUTLEY TULIP SOCIETY.

THE seventy-fourth annual exhibition of this old time Society was held at the Orange Tree Inn, Butley, near Macclesfield, on Friday, June 9th, and although the flowers were of excellent quality, yet there was a note of sadness apparent among the small body of growers present as they thought of the days gone by and of the men who used to meet them in this pleasant Cheshire country, now, alas! gone into the silent land.

But as the Irishman said, "We must live while we can," and it is encouraging to say that although exhibitors were few, yet the flowers were of very high quality, and on the whole were better than those exhibited at the National Show at Manchester on June 2nd. Feathered flowers were exceptionally well shown. Bertha, Coningsby, Bessie and Mr. Hepworth, bybloemens; Wm. Wilson, Rifleman, Wm. Annibal, Jas. McIntosh, and Typo, bizarres; Mrs. Atkin, Heroine, Miss Edwards, and Lizzie, roses, were almost perfect. Flamed flowers, although good, were not quite up to the average, and the breeders showed signs of the ungenial spring in many cases. The only novelty of any note was a feathered bybloemen heavily feathered with purple on an exquisitely pure white ground, called "Jack," a seedling of Mr. Bentley's. The silver cup given by the President, Mr. C. W. Needham of Royton,

was awarded to Mr. J. W. Bentley, Kersal, Manchester, for the best stand of six rectified flowers. He showed Sir J. Paxton, flamed; Wm. Wilson, feathered; A. McGregor, flamed; Mrs. Atkin, feathered; Talisman, flamed; Conningsby, feathered. The following awards were also made by the Judges, Messrs. Housley (Stockport), and J. Woodhead (Staleybridge).

Premier feathered Tulip in the whole Show, Mr. Bentley with Bertha. Premier flamed Tulip, Mr. Bentley with Sir J. Paxton. Premier breeder Tulip, Mr. Bentley with Rose Hill.

Stands of Three Breeders.—First, Mr. Bentley with Goldfinder, Rose Hill, Agnes. Second, Mr. Needham with Lloyd's 208, Mabel, Beauty of Litchurch. Third, Mr. Buckley, with Sulphur, Mabel, Queen of the May.

Feathered Bizarres.

- 1 Mr. Bentley, with W. Wilson
- 2 Mr. Bentley, with Rifleman
- 3 Mr. Bentley, with W. Wilson
- 4 Mr. Needham, with W. Annibal
- 5 Mr. Bentley, with Lord Lilford
- 6 Mr. Needham, with J. McIntosh
- 7 Mr. Needham, with Typo
- 8 Mr. Bentley, with Magnum Bonum
- 9 Mr. Bentley with John Mills

Feathered Roses.

- 1 Mr. Needham, with Mrs. Atkin
- 2 Mr. Bentley, with Mrs. Atkin
- 3 Mr. Bentley, with Heroine
- 4 Mr. Bentley, with Miss Edwards
- 5 Mr. Needham, with Lizzie
- 6 Mr. Bentley, with Mrs. Collier
- 7 Mr. Bentley, with S. Headley
- 8 Mr. Bentley, with Sarah Ann
- 9 Mr. Bentley, with Kate Connor

Feathered Byblæmens.

- 1 Mr. Bentley, with Conningsby
- 2 Mr. Dymock, with Lady Denman
- 3 Mr. Bentley, with Bessie
- 4 Mr. Buckley, with Mrs. Hepworth
- 5 Mr. Bentley, with Jack
- 6 Mr. Bentley, with Mrs. Jackson
- 7 Mr. Bentley, with W. Parkinson
- 8 Mr. Bentley, with Sylvester
- 9 Mr. Bentley, with Bertha.

Bizarre Breeders.

- 1 Mr. Bentley with Sulphur
- 2 Mr. Bentley with R. Yates
- 3 Mr. Bentley with Thurstan's 121
- 4 Mr. Bentley with Lloyd's 103
- 5 Mr. Buckley with Lea's Seedling

Byblæmen Breeders.

- 1 Mr. Needham with Ashmole's Seedling
- 2 Mr. Bentley with Glory of Stakehill
- 3 Mr. Bentley with Alice Grey
- 4 Mr. Bentley with Seedling
- 5 Mr. Bentley with Leech's Seedling

Sels.—1 Mr. Bentley with Cygnet. 2 Mr. Bentley with Golden Beauty. —J. W. B.

THE YOUNG GARDENERS' DOMAIN.

EXHIBITION VEGETABLES.

A GOOD method of growing Peas, Dwarf and Runner Beans, and Broad Beans for exhibition is to prepare trenches in a similar way to those that are made for Celery. Take out a trench about 2 feet deep and 1½ foot wide, fill in with rich manure, place about 4 inches of soil on it and make the whole trench moderately firm by treading, which will bring it level with the surface. If Peas are sown make a point of having the best seeds obtainable, placing these 3 inches apart, Runner Beans 8 inches, Broad Beans 8 inches, and French Beans 6 inches asunder. Place sticks to those plants that require them in good time, and if the weather is dry, pour into the trenches about 4.30 P.M. a good supply of water that has been exposed to the sun; by no means use water from a spring or well, or mildew will soon put in an appearance.

When gathering the pods of Peas, great judgment should be exercised. They must be handled carefully, the bloom not rubbed off, and be full of luscious Peas, neither too old nor too young. If some of the pods on the rows are a little too early, they can be gathered quite eight days before the show and placed in saucers of wet sand, the stalk end only being inserted, and kept in a cool darkened cellar. Keen competition is generally evinced in the Pea classes, especially by amateurs; some cottagers also grow excellent pods and exhibit them at their local shows.

A well staged collection of vegetables is a treat to behold. If the show is in July and twelve distinct varieties are required, the following may be chosen—Potatoes, Cabbages, Cauliflowers, Vegetable Marrows, Peas, Beans, Onions, Turnips, Broad Beans, Cucumbers, Tomatoes, Carrots, and Lettuce, all in exact accordance with the stipulations. Tomatoes materially brighten a collection of vegetables. Parsley is the best greenery for garnishing. It should be freely used, but at the same time must not cover any of the vegetables, each of which should have room to show itself to advantage. I will deal with some of the principal kinds of vegetables in another communication with the Editor's permission.—FOREMAN X.

[It is readily granted, as our correspondent appears to be familiar with the subject of growing and showing vegetables.]

HARDY FRUIT GARDEN.

Summer Pruning Fruit Trees.—Summer pruning, if carried out on right lines, not merely shortening shoots at random because they have grown long, is beneficial to the trees operated upon. As usually understood, summer pruning is the shortening back of foreright or side shoots on restricted fruit trees which have grown a considerable length from their original starting point. If allowed to remain unshortened the continued growth, especially if strong, abstracts sap which might be doing service in building up fruit buds at the base.

This is the object of summer pruning, and in the majority of cases it is attained, if the growths are shortened when the lower half-dozen leaves have attained full size. The shoots may then be pruned back to four or six leaves, according to their strength. With the strongest shoots four leaves will be ample to retain. Weaker growths shorten to six leaves. Where thickly placed it is a good plan to reduce the number of the summer shoots, cutting out the weakest entirely. It is best to have a limited number of shoots to each clump of spurs, as the more light and air that can reach the basal leaves the better. Shortening, without taking the precaution to thin if necessary, creates a thicket of growth.

Another method of summer pruning is not to shorten any shoots or branches, but simply to thin out and regulate growth. The form of tree on which this style of pruning is found to act best is the open bush and standard. Thinning branches can be carried out as well in summer as winter. Cuts heal sooner, and there is the advantage of seeing to what extent it is necessary to remove growths.

The preceding remarks on summer pruning refer chiefly to Apples and Pears. The summer growths of Plums and Sweet Cherries are best pinched or shortened to three good leaves in dealing with trees or bushes restricted in form. Standards and half-standards need little pruning, especially if well trained when young.

Morello Cherries make abundance of wood in a season. This requires some thinning, regulating, and laying-in without any shortening, cutting out the bearing shoots of the present season as the fruit is gathered.

Gooseberries on walls must be summer pruned like Red and White Currants. The side shoots or foreright growths are shortened to three pairs of leaves. Bush Gooseberries may be thinned and regulated later on.

Black Currants require no shortening at the present time, but crowded shoots or branches may be removed after the fruit has been picked.

Watering Fruit Tree Borders.—The importance of maintaining the borders moist at the present time is very great. Trees on walls carrying good crops must not suffer from lack of moisture in the soil, for with this there is also absence of food for the roots. Heavy demands are made now upon the trees, for in addition to carrying and sustaining the crop there is extension and perfecting of growth for the succeeding season. It is a wise plan to check evaporation from the soil by a liberal mulching of manure over the roots immediately after a copious watering has been given. Further waterings may be given over the mulching, and liquid manure applied. A moist condition of the soil promotes and maintains a healthy condition of the foliage, which wards off attacks of red spider and aphids.

Borders with plenty of natural drainage and on light soils feel the effects of dry weather sooner than those on retentive ground. Where the surface of the border is smooth and caked it should be carefully pricked over with a fork, doing this without injuring the roots if many are situated near the surface.

Newly planted fruit trees on walls and in the open are not only benefited by liberally watering the roots, but by syringing to cleanse and maintain the foliage fresh.

Strawberries.—*Netting Fruit.*—Covering the beds with nets must be adopted immediately the first fruits begin to colour. Forked sticks can be driven down at intervals on each side of the beds, and cross pieces laid over on which the nets may be stretched, fastening them down at the sides to prevent birds passing underneath.

Feeding and Watering.—Healthy plants developing good crops may be fed freely with liquid manure while the fruit is green. Water should be given previously on light dry soils. Considerable nutriment is derived from a liberal mulching if the virtues contained in the manure are washed into the soil, so that the roots may appropriate the food. Feeding need not be continued after colouring commences.

Thinning the Fruit.—There is some advantage in reducing the number of fruits where a heavy crop has set. Many of the smallest and deformed may be cut out.

Early Propagating.—The runners from good fruiting plants may be layered when the first plantlet shows roots. These layers are choice, and may be employed when established for forming the first new bed or for growing as pot plants. The methods of rooting Strawberry layers are various, but for these early plants the best way is undoubtedly that of securing them on the surface of small pots filled with good loam and manure pressed down firmly. The soil must be kept moist, and the runners beyond the plantlets nipped off early.

FRUIT FORCING.

Melons.—Plants with the fruit ripening must have a plentiful supply of air, and water should be withheld from the fruit. If the plants are strong, and there is a disposition to crack, in addition to withholding water, cut the growths carrying the Melons half through, a few inches below the fruit. A dry atmosphere is essential, and a temperature of 70° to 75° artificially, falling about 5° at night. If the sun be powerful, place a slight shade of some kind directly over the fruit, so as to insure their ripening evenly and gradually. Water only to prevent flagging. A slight shade after a dull period is better than heavy waterings and a close vitiated atmosphere.

Fruit Swelling.—Add more soil to the ridges or hillocks. It should be warm, moderately heavy, rather moist, and pressed firmly. Water will be required about twice a week, regulating this according to the plants. Remove all fruit but three or four on a plant, also blossoms, and afford the needful supports. Stop or remove laterals, not great reductions, but little and often, not allowing them to interfere with the principal growths. Syringe twice daily. On bright mornings commence ventilating about seven o'clock, or at 75°, and increase it with the advancing sun, keeping through the day at 80° to 90° with bright sun. Close at 80° to 85°, increasing to 90° or more.

Plants Setting their Fruit.—The plants should have the foliage thin in disposal, so that air and light may have free access. The growths will then be stout and short-jointed, and the foliage thick in texture. The blossoms also will be proportionately strong. Ventilate a little constantly, and if dull have a little warmth in the pipes to cause a circulation of air, and when the heat falls below 65° at night, or 70° to 75° in the daytime. The soil must be sufficiently moist to prevent the leaves flagging, and only moderate moisture will be required in the atmosphere, damping in the morning and afternoon, but keep the water from the plants. Fertilise the blossoms about noon on fine days, and when several are expanded on a plant, stopping at one joint beyond the fruit to insure uniformity of swelling.

Young Plants.—Train with one shoot for trellises, and rub off the laterals up to the first wire, and then every alternate lateral on opposite sides afterwards, stopping the leading shoots when about two-thirds up the trellis. Flowers ought to appear on the laterals, if they do not show at the second joint stop at that. Plants for training over the bed should be stopped at the second leaf. Select four of the resulting shoots, training two to the back and two to the front of the frame or pit. Remove all others carefully, but if only two shoots result stop them at the second or third leaf, and make a selection of the best for training. Keep the stem clear for a space of about 6 inches from the collar. Remove every alternate lateral on the shoots, stopping these 12 to 15 inches from the sides of the frame. Let there be no deficiency of moisture at the roots, and add fresh soil to the hillocks as the roots protrude. Syringe at closing time, but avoid wetting the stems, as it may lead to canker, which should be kept under by rubbing quicklime into the affected parts until dry. Provide the necessary ventilation for insuring sturdy growth. Close early, and keep the growths well regulated not less frequently than once a week. Shade only to prevent flagging, it will only be necessary for an hour or two at midday under powerful sun.

Sowing for Late Fruit.—A last sowing should be made at once for planting in manure-heated pits and frames. Plants from this sowing will afford fruit at the latter part of September, and be useful if properly attended to. Those with light well-heated structures may continue to make sowings as required until the end of July. The plants from the last named sowing will continue the supply up to the beginning of November, after which the fruit is generally of very moderate quality.

Peaches and Nectarines.—*Early House.*—The fruit will shortly be all gathered, therefore admit all the air possible day and night. If the roof lights of the earliest forced house are movable, take them off after the trees have had full ventilation for a fortnight, and keep the trees free from insects by forcible syringings. Let the borders be duly watered, affording liquid manure to weakly trees, which helps them to plump the buds, and mulch with short manure. Cut away the wood which has borne fruit to the shoot at the base intended to bear fruit next season, unless such shoot is required for extension. If there be any superfluity of shoots remove them now; they only keep air and light from the principal foliage, and hinder cleansing operations. Keep laterals and any gross shoots closely stopped.

Houses with Fruit Ripening.—The trees must not be syringed, but moderate moisture should be maintained until the fruit is ripe; even when ripe an arid atmosphere should be avoided, as it is highly prejudicial to the foliage. Water must also be given liberally at the roots. Admit air abundantly. In gathering Peaches great care is necessary, as the least pressure makes a mark and spoils their appearance. A piece of wadding should be held in the hand, and the fruit removed by gentle pressure, then laid gently in a basket or tray. A cool and airy fruit room is the best place for Peaches and Nectarines after they are gathered.

Trees Swelling their Crops.—When the stoning is over the trees will endure strong heat without fear of the fruit falling. Afford tepid liquid manure to the roots of trees carrying full crops, and not otherwise too vigorous. Be careful in giving liquid manure to very vigorous trees, as it tends to over-luxuriance, and may interfere with setting and stoning in the succeeding year. Still, liberal treatment is necessary, such as light surface mulchings and copious waterings every week or ten days in well drained borders. Syringe twice a day to keep down red spider, ventilate early, keep the temperature through the day at 70° to 75°, 80° to 85° with sun, and close the house sufficiently early to increase to 90°. This, with

abundance of moisture in the house, will insure large fruit, and if ventilation is given before nightfall and increased early in the morning, all will be well; but if a close and moist atmosphere be maintained with high temperature the fruit, though large, will lack flavour. Keep the fruit with the apex to the light, laths across the trellis will admit of this being done, and clear away the leaves from the fruit, but do not remove them if it can be avoided. When approaching ripening cease syringing, admit air freely, and 60° to 65° at night will be sufficiently high temperature artificially in the daytime, unless it is wished to accelerate the ripening, when it should range from 70° to 75° with a rise from sun heat.

Late Houses.—Train the growths thinly, reserving a shoot at the base of the current year's bearing wood, and stop those on a level with or above the fruit at two or three leaves, and succeeding growths at a joint or two. Side shoots on extensions not required to form bearing wood, or for furnishing the trees, stop at an inch or two of growth to form spurs. Thin the fruit to a few more than will be required for the crop, retaining the largest and best placed. There should not be more than one fruit to each square foot of trellis covered by the trees, but a few more may be left to meet casualties in stoning. Syringe twice daily except on dull days. During the prevalence of dull weather an occasional syringing will be all that is required, as it does not answer to keep moisture hanging on the foliage. Water inside borders as necessary, and afford liquid manure to weakly trees. Mulch the borders lightly with short manure, and keep it moistened as it becomes dry.

THE BEE-KEEPER.

SHADING AND VENTILATION.

It is of importance that bees should have attention at the proper time, and the shading and ventilation of hives must not be neglected. The present spell of bright weather is so beneficial both to strong and weak stocks that close attention should be given to this subject. We prefer ventilating hives from underneath the brood nest, and where perforated zinc floors are in use these are often found to afford ample ventilation during the hottest days of summer. But from experiments made with them we are inclined to think bees winter better with solid wood floors, as zinc is very cold, and bees have a great aversion to walking over a cold surface in winter. However, many bee-keepers highly approve of zinc floors for their bees, as they allow a circulation of air at all times.

If the hives have loose floor boards ventilation is a very simple matter, as the body of the hive may be wedged up as much as is required. When this is done the full width of the hive the bees have ready access, and it will not be necessary for so many of the bees to be fanning at the entrance, as is always the case during the prevalence of hot weather if the entrance is not large enough. This is done by the bees to lower the temperature of the hive.

We do not recommend giving ventilation at the top of the hive, as this reduces the warmth where it is most required. Shading should then be resorted to, and this will often have the desired effect. It is also an advantage to shade stocks when the body of the hive is wedged up its full width, as during a spell of very bright weather bees will often swarm. This might have been prevented had shading and ventilation been resorted to in time, before the bees made preparations for swarming. Those who have not previously tried this plan will be surprised at their immunity from swarming.

COMB FOUNDATION.

The most important aid to success in bee-keeping is comb foundation. This fact is now pretty well known to the majority of bee-keepers. The genuine article is made from pure wax, which is rolled into sheets varying in thickness. Those intended for supers usually run about sixteen sheets to the pound, whereas those used for the brood chamber will be of double thickness.

It may be used in various ways, a narrow strip fastened to the top bar of the frame being sufficient to act as a guide; from this the bees will build straight combs. It is, however, a great saving of labour to the bees if full sheets of foundation are used, as much honey is consumed by the bees in making sufficient wax to fill an ordinary sized hive with comb. We prefer strips of guide comb for sections, as the midrib of the comb will be found to be much thinner when made by the bees than when foundation is used.

If the top bar of the frame is split the edge of the foundation may be placed in the opening, a wire nail will hold it in position, and if the hive is placed level nothing more will be necessary. A beginner should always use thick sheets of foundation, averaging about eight sheets to the pound. After some experience with these thin super foundation may be used in the brood chamber. In our own apiary we never have anything else. It is necessary, however, to use them between fully drawn out combs, otherwise they may break down.—AN ENGLISH BEE-KEEPER.

TO CORRESPONDENTS

•• All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," 8, Rose Hill Road, Wandsworth, S.W., and NOT to 12, Mitre Court Chambers, Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor. Letters of inquiry must be accompanied by the names and addresses of the writers, but these will neither be published nor disclosed when initials or *nom de plumes* are given for the purpose of replies.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and it is convenient when each question is written on a separate sheet. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Peach (*Ignoramus*).—We are sorry to say the fruit arrived in a smashed state, the result, mainly, of over-ripeness at the time of packing. Only a small portion was in something like a normal state, and the colour, also the glands on the leaves, were the same as those of Waterloo. If the flowers are large we suspect that is the name of the variety, but if they are small it is possibly Early Louise. Both are first early Peaches, the last named raised by Mr. Rivers, the other of American origin.

Moth (*Insect*).—The moth enclosed is familiarly called the Humming-bird Hawk (*Macroglossa stellatarum*), for it flies with a sonorous hum, and its movements suggest a comparison to the humming-birds of the tropics, though it lacks their lively colours. It has been seen nearly every month of the year, but its chief seasons are spring and autumn, when it visits flowers both by day and night. The moth seems to pass the winter in a semi-torpid state, but is tempted out by gleams of sunshine. Eggs are deposited during spring; the caterpillars feed upon species of Bedstraw in July and August; they have a horn at the tail. There is but one yearly brood, and it is a species quite harmless in gardens.

Ashes of Rank Weeds (*T. A. C. C.*).—The ashes of rank weeds, such as thistles and nettles, are beneficial to cast over the garden, as they are rich in potash and other plant food, as per analysis by Dr. Emil Wolff subjoined:—

	Potash	Soda	Lime	Magnesia	Iron...	Phosphoric acid	Sulphuric acid	Silica	Chlorine	Thistles.	Nettles.
	31.16	48.00
	0.54	2.75
	47.13	20.08
	5.00	5.89
	2.29	3.14
	6.10	5.38
	3.32	6.13
	3.98	—
	0.62	9.98

If the weeds are reduced to ashes there is no possibility of their reproducing themselves again.

Unhealthy Vines (*Copley*).—We suspected there was something wrong with the roots. If there are abundance of fibres, as ought to be the case, in the narrow inside border encourage them by top-dressings and the judicious use of mild stimulants, remembering that excess is injurious. The outside border is probably sour, but may with care be renewed when you have a plenitude of roots in the house, without material check to the Vines. Phylloxera does not cause the fruit to crack without affecting the leaves. Both cracking and mildew are incited when the roots are defective either through sour soil or an excess or deficiency of water, with, at the same time, a too moist atmosphere and a fully too low night temperature. Do not over-crop, and never allow the house to get too hot before increased ventilation is given. We have known more than one crop of Grapes seriously damaged by mildew, the result of too late ventilation on Sunday mornings, and then throwing the ventilators widely open by thoughtless young men to "bring down" the temperature. We do not suggest this has occurred in your case, and we mention the facts as condemnatory of such practice, which is not quite extinct. The worse the Vines that have fallen to your charge the greater will be the credit due to you on their restoration.

Treatment of *Dendrobium nobile* (*Ignoramus*).—Your treatment so far has been quite correct, and you should now get all possible growth into the plant. Towards the end of the summer you will see that the growths are finished by the last leaf appearing on the top of the stems, and the latter rounding up, so to speak. At that time allow the plants full exposure to the sun, and a little more air than they have been used to. This will harden the growths—ripen them, as it is termed; and when the stems are quite finished, the plants may with advantage be placed in quite a cool and very light house to rest. You will find no difficulty in telling when the growth is finished for the season. The plant should be slowly introduced to more heat again in spring—not suddenly, or this may cause the flowering nodes to produce growth instead of flowers. Avoid watering too liberally at the roots until these are very active.

The Pear Tree Slug (*Fruit Foreman*).—The Pear leaves are attacked by the Pear tree slug, the larva of *Selandria æthiops*, known also as *Tenthredo adumbrata*. The slimy black slugs eat away the parenchyma of the leaf, as shown in the illustration (fig. 117), and are frequently very destructive to wall trees, bringing growth to a standstill and causing the fruit to drop. Miss Ormerod, in her "Manual of Injurious Insects and Methods of Prevention," says:—"The slug-worm attack can be checked by dusting or syringing. The caterpillars, if annoyed by throwing a caustic powder on them, such as quicklime or gas lime, can throw it off at first by exuding a coat of slime, and thus, as it were, moulting off the obnoxious matter; but they cannot keep on continuing this process; therefore a second application of the powder (of course soon after the first)

FIG. 117.—PEAR TREE SLUG.

takes effect and kills them. If a good time is allowed to elapse between the dressings, they will have regained the power to produce the slime exudation, and the dressing will do little good. Heavy syringings of the tree with strong soapsuds, applied by a powerful garden engine, are effective in getting rid of this pest. Tobacco water will destroy them; and lime water has also been found useful, in the proportion of a peck of lime to 30 gallons of water; it may be noted that if 2 lbs. of softsoap are added, it will improve the mixture."

Watering Young Trees (*N. B.*).—There are not many trees more difficult to establish than recently planted Scotch Firs, and the larger they are when removed the greater is their liability to succumb during dry weather in summer. We have seen them fail in hundreds, and even thousands, when there have been few losses among Larches and other kinds planted at the same time. Watering is certainly beneficial when done soon enough and in the proper manner, followed by mulching, and supplemented by syringing or spraying the trees. All this can be done when water is handy and the trees comparatively few. Daily sprinklings of the surface soil is labour wasted. The soil must be made thoroughly moist from the surface downwards, well below the roots. To effect this one, two, three, or more pails of water may be required for each tree, according to its size and the porosity or otherwise of the soil. When the soil is thus made moist it should be kept so as long as possible by mulching, or covering the surface, while still moist, 3 or 4 inches in thickness with manure, partially decayed leaves, short grass, or anything that can be applied to prevent evaporation; or if nothing of the kind can be done, by running the hoe through the surface on the morning following the evening watering, for breaking up the fissures which form by the shrinkage of the soil and through which the precious moisture escapes into the air. An inch or two of loose dust prevents this to a greater extent than many persons imagine. The supplementary syringing or spraying the trees is of great importance in preventing or checking evaporation from the leaves. So long as they are wet there is no escape of moisture from them; the longer they remain dry the greater is the loss, and when this exceeds the amount supplied by the roots the leaves shrivel and the trees suffer or die. We have known men constantly employed in syringing recently planted trees and shrubs in pleasure grounds during hot sunny days in early summer, and beyond doubt with great advantage, the roots at the same time being kept moist. We shall be glad if you can adapt some of the information we have endeavoured to impart to your own circumstances; but in the meantime you may have, as we hope, refreshing rain.

Abnormal Tulip (R. B.).—The specimen you send, though not unique, is unusual, and because it is interesting an illustration will be given in a future issue.

Mowing Lawns in Dry Weather—Machines Clogging (O. F.).—You ask "if it is a good plan to keep off the grass box of a mowing machine, particularly during such hot weather; or are the droppings of grass apt to clog mowing machines?" In mowing lawns when the grass is very dry, there is no more liability to clogging when the box is off than when it is attached to the machine. Except when the grass is very long, it is advantageous rather than otherwise to let the machine scatter the grass evenly on the lawn during dry hot weather in summer. We have not removed any grass from our lawn during the past three weeks, and it has been the same no doubt over hundreds of acres where machines have been run over the surface weekly. When machines clog in wet weather, it is an excellent plan after using them to turn them on their sides, and flush them out with hot water before putting them away. The working parts are then cleansed, dry immediately, do not rust, and are in good condition when wanted again.

Vine Leaves Warded (J. M.).—Both the Black Hamburgh and Gros Colman leaves are warded. This is mainly caused by a close, moist, and warm atmosphere, which retards evaporation, and causes an abnormal growth of tissue on the under side, with corresponding depressions on the upper surface of the leaves. The warts seriously interfere with the transpiration, and not infrequently the leaves become scorched, and the foliage in some cases falls prematurely. Otherwise the warding does not materially affect the health of the Vines, and they usually finish the crop well, other conditions being favourable. Of course it is best to avoid the abnormality by judicious ventilation, especially in the early part of the day; and it is necessary to be very careful in this matter after a dull period, as the leaves are then tender, and the more liable to receive a check by exposure to hot sun. In other respects the Vines, judging from the leaves, are in good condition. You have to remember that on a west aspect the sun has attained great power when it reaches the house, and you must act accordingly. We should leave the top ventilators slightly open all night, though they may be closed for a time after damping or syringing in the afternoon or evening, according to the weather.

Names of Plants.—We only undertake to name *species* of cultivated plants, not wild flowers, or varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in securely tied firm boxes. Thin paper boxes arrive in a flattened state. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool or paper the worst. Those arrive in the best condition that are so closely or firmly packed in soft green fresh grass, as to remain unmoved by shaking. No specimens should be sent to rest in the post office over Sunday, on which day there is no delivery of postal matter in London. Specimens in partially filled boxes are invariably injured or spoiled by being dashed to and fro in transit. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (R. B.).—*Lamium maculatum aureum*. (J. M.).—1, *Ilex aquifolium* var. *scotica*; 2, cannot be positively identified, but very closely resembles some of the forms of *I. aquifolium* *Hodginsi*; 3, *I. aquifolium aurea marginata*. (Garden Boy).—A rather old boy, we suspect, judging by your letter, but all the same, you failed to see the correct editorial address prominently given at the head of the "Correspondents" page and elsewhere. Nor did you observe that we only undertake to name "species" (not varieties) of "cultivated" plants. If you do not know the difference, as many "boys" do not, you should try and learn. We have now to say that by the delay caused in sending the parcel to the wrong address, and not packing the specimens in soft green grass or damp moss, they arrived in such a shrivelled state as to be practically beyond identification. We can only say that 1 appears to be *Saxifraga ceratophylla*; 3, a *Fumaria*; 4, a *Salvia*, possibly *S. Heeri*. The Rose we suspect is the old Maiden's Blush. We would have named the specimens if they had arrived in a reasonably fresh state, though in the future you must be so good as to comply with the published conditions. (R. C. N.).—*Halesia tetraptera*, see page 509; *Genista hispanica*. (W. B. R.).—The flowers had fallen, but we are endeavouring to expand one bud for identification.

COVENT GARDEN MARKET.—JUNE 21ST.

Bedding out plants in variety from 3s. doz.

BEER DRINKERS v. BREWERS.

OR we might say, The People v. Farmers. Such used to be the case, but it now appears as though the farmer is to be left out of the matter. In most countries we find what we may term a national beverage—the drink of the people; something cheap and wholesome and something peculiarly adapted to the wants and requirements of the climate, "home grown," the manufacture of which is a source of modest wealth to several sets of people—the grower of the raw material, the more skilful manipulator, and the honest retailer. And it seems to us a great pity that for the sake of the extra profits filling the pockets of the few that the national beverage should be of alien growth.

We find there are districts in England peculiarly adapted for the growth of the best class of malting Barleys. We find that there is a class of men who have spent their lives and brought the wisdom of their forefathers to bear on the improvement of these Barleys, till at last they have got something as near perfection as possible; we find these men, by means of their Barley growing, able to afford good wages to a large class of labourers, to pay a fair rent, and to supply the nation with excellent mutton into the bargain (for mutton and Barley production must go together). And now it appears highly probable that these men will find their occupation gone, their crops unremunerative, their landlords and labourers unpaid, and this good Barley land thrown out of cultivation. It will take a wise man to calculate the loss to England in general should such a thing happen.

The strong heavy clay went out of cultivation first, and all hopes were rested on the lighter and more easily worked wold and cliff lands. People were under the impression that though we might import Wheat with advantage to the greater community, yet as ours

was the best Barley and mutton in the world there would still be a trade for those two commodities, and that men who embarked in that branch of agriculture were sure of a living.

The Barley has not deteriorated, neither has the mutton become lean and stringy. It is the mania for the cheap and nasty that appears to have seized the majority.

By the slow workings of time alterations have taken place in many manufactures. The great firms absorb the work; the lesser firms go to the wall or are amalgamated in the greater. These firms become companies with shareholders, and shareholders look for dividends (large if possible), so it becomes essential that every detail be worked with the greatest economy, not for the benefit of the purchaser, but for the swelling of the dividends.

The purchaser's interest is not consulted, and so we find that these great brewery companies are employing substitutes for the sweet wholesome malt grown on English farms, and taking in its place all manner of foreign grain that we cannot produce, and filling the alien's pocket with our gold.

If this beer were as good as the old-fashioned "nut brown" of our fathers we might not grumble much, and especially if it were retailed at a correspondingly low rate; but when we find that we have still to pay 3d. per pint for a very inferior article—a drink that increases instead of assuaging our thirst; a drink that is positively injurious to our health—we think we have a just cause of serious complaint. What is sauce for the goose ought to be sauce for the gander; yet a grocer is bound to declare if his coffee be pure Mocha or a mixture of chicory—in fact, all food purveyors are subjected to severe pains and penalties for adulteration, and yet the brewer goes on his way unmolested and unchecked.

Have our readers any idea at all as to the quantity of materials other than malt now used in the production of beer? We think not. What will they say when we tell them that sugar, raw grain, Rice, and Maize used by brewers is equal to 12,500,000 bushels of Barley malt? To produce this Barley we should need 400,000 acres of land, and we should bring into Barley cultivation on the four-course system 1,600,000 acres. This would go a long way to resuscitate English agriculture; and why should not we have this money and work in our hands instead of paying it over to the producers of sugar, Rice, and Maize? Why, indeed? It is the old story—the haste to be rich. The brewing brotherhood are very strong, and practically have the power, both in and out of Parliament, to do exactly as they like; they grow rich, they get the monopoly.

Twenty-five years ago a 36-gallon of beer cost 24s. to produce—that included the malt tax; to-day the same 36-gallon can be concocted for 12s. 6d. Less Hops are used (a valuable bitter), Barley substitutes, the beer is weaker, and the retail price continues the same—and the breweries pay big dividends.

From 40s. per quarter, in four years Barley has dropped to 23s. 3d., and where the decline will stop no one knows. As land goes out of cultivation, the large farmers either break or retire on a remnant of their means, the landlord retrenches on every hand, and the labourer goes to swell the already immense population of our towns.

WORK ON THE HOME FARM.

Another week of bright sunshine has done wonders for the grain crops. Wheat now looks wonderfully well and will soon be in ear. There may and should be quite an average crop of grain, but there will not be as much straw as there was last year. Barleys have improved, but still are not very satisfactory. A few genial showers would do much good, and in addition to encouraging the Barley would refresh the Clovers, which are still too young to stand a long spell of drought.

Turnips put in early look really well, the next sowing are only just peeping, but appear to be coming well. We hear complaints from strong land districts that Turnips cannot be got in at all. The land has baked as hard as a brick after the soddening influences of the heavy rains in May. Such land required taking in hand and getting ready at one exact time during the drying process, perhaps during only one day would it be in the proper condition to work down in anything like form, so that a farmer with a large acreage of such like land, and only an ordinary force of horses cannot be blamed if he has not taken advantage of such a very fleeting opportunity. How to get the work of the farm done at all seems to be the problem of the future.

We see reports from the North that farm servants were never so difficult to engage at the May day hirings, and scores of those who were engaged declined to fulfil their engagements, and have had to appear in the police court to answer for their delinquency; in some cases the only plea being that they had let themselves too cheaply, and had afterwards obtained better terms.

We are sowing sulphate of ammonia on the Potatoes, 2 cwt. per acre, and earthing the Potatoes up as they become high enough. Care has to

be taken only to sow the sulphate when the haulm is absolutely dry, otherwise much damage may be done. The haulm must be really dry to the touch, even a slight dew would hold the manure on the leaves and cause damage as serious as that from a sharp frost.

Mangolds are growing well, and it is a capital time for cleaning them. The first top-dressing, in the shape of 1 cwt. of nitrate of soda, should be sown at once after the plants are thoroughly cleared of weeds. Do not wait for the singling process, top-dress now and thin out after, then the manure will be ready to carry the plants on after their check.

HEREFORDSHIRE AND WORCESTERSHIRE AGRICULTURAL SOCIETY.

ON the occasion of the meeting of this Society at Stourbridge last week Lieutenant-Colonel Webb and Mr. Edward Webb entertained a large and influential company to dinner in the Town Hall, Colonel W. G. Webb presiding. Lord Cobham, in speaking on agricultural depression, observed the great shows, such as the Royal, the Bath and West of England, the Smithfield, and the Birmingham and others, did much good to agriculture in their way and in a manner which they in their society could not attempt to imitate. In them they had very rich men who showed beasts which had been brought to the utmost pitch of perfection, regardless of the profit upon the transaction. They were rich men spurred on by the rivalry of other rich men, and they served a useful purpose in showing them to what perfection the stock of the country could be brought to under judicious management; but profit did not come into the matter, and even those larger shows he wished that more encouragement could be given to the production of stock and crops upon purely economical and commercial principles. The time had long past when it was thought that the fool of the family might be put to agriculture, for farming now had become more scientific and more business-like occupation. Mr. Haskew, in reviewing local progress, said coming to their more immediate manufacturers he should not omit the marvellous growth and prosperity of their neighbours, whose name was world-wide, that of Messrs. Edward Webb & Sons, the royal seed growers. Their name was known not only in the civilised, but also with the more uncivilised portions of the world.

Colonel Webb, in replying, said they had heard some able speeches that evening upon agriculture, and he perfectly agreed with a good many, but there were some which required the earnest consideration of agriculturists, not only in Herefordshire and Worcestershire, but in other counties as well. More attention might be given to many things, he thought, and especially to fruit growing, which had not been mentioned that evening. There was a great field for fruit growing if Worcestershire and Herefordshire would only take it up. He touched upon the advance of science in growing crops, especially Hops, so much so that now they could almost always insure a crop, and passed on to another branch which had been forgotten—that of poultry rearing. It might be said it was only a minor matter, but he reminded them it was the "mickle that made the muckle," and it behoved them, as agriculturists, to pay attention to the minor details, for the next few years which they would have to face would be trying ones.

Mr. Edward Webb also thanked them all for the very kind manner in which they had drunk the health of his brother and himself. As chairman of the local committee his work from the first to the last had been a labour of love. The town welcomed the show with the greatest possible pleasure, and wished it every success. He hoped what his brother had said as to agriculture would live in the future with them. They had to-day low prices for Wheat and many other grains, but they had had reductions in rents, which, he trusted, together with good seasons, would bring about better prospects in the future.

Journal of Horticulture.

THURSDAY, JUNE 29, 1899.

THE JOURNAL OF HORTICULTURE can be obtained from the Office, 12, Mitre Court Chambers, Fleet St., London, post free for a Quarter, 3/9. Editorial communications must be addressed to 8, Rose Hill Rd., Wandsworth, S.W.

THE ROYAL HORTICULTURAL
SOCIETY.

RARELY, if ever, has this, the chief horticultural society of the kingdom, been more active than at the present time, and large accessions of new Fellows are gratifying incidents of every meeting. The work it does is also strictly in accordance with its charter—namely, “the improvement of horticulture in all its branches, ornamental as well as useful.” Neither decorated donkeys nor other floral frivolities have intruded on its domain. Interest appears to increase in the various trials at Chiswick, and the meetings in London bid fair to outgrow existing conveniences. So apparent is this that it is questionable if the provision of an appropriate centre for exhibits and visitors is not even more urgent than a “new Chiswick.” The old garden is not done yet, and can be made of great use to the Society for still more years, while in the Westminster Drill Hall there will soon be “no room to live.”

We are reminded of the chief function of the season by the arrival of a prospectus setting forth the plan and proceedings of the International Conference on Hybridisation and attendant exhibition. This conference was a happy idea, and is evidently to be carried out on a comprehensive scale. The subject, besides being fascinating, is of the greatest importance, and in potentialities illimitable. The proposition has “caught on” amongst leading hybridists and botanists in various countries, nearly forty, we believe, being expected from abroad.

Last week we published a list of Veitch Memorial medals for the best new cross-bred or hybrid fruits, flowers, and vegetables, the result of intentional (not accidental) cross fertilisation. It may be stated for the information of the inexperienced in such matters that when pollen is transferred from one variety of flower to another of the same species the resulting seedlings are cross-breeds, but if the transfer of pollen is between two distinct species of a genus the influenced seedlings are hybrids; if between species of different genera they are

No. 2648.—VOL. C., OLD SERIES.

b eneries or ligeneric hybrids. Thus there are a thousand times more cross-breds than hybrids or bigeners, or both. We insert a letter on the subject of what is "new" in the sense required for winning the Veitchian medals.

WHAT IS A NEW FRUIT OR VEGETABLE?

I ask this question because of the list of Veitch Memorial medals offered for distribution at the Hybridisation Conference just published, and which should be eagerly sought for by hybridists and cross-breeders. But it will doubtless occur to others beside myself, that if such awards to hybridisation could have been made public a year or two since, a great incentive would have been given to labour in the field of cross-breeding. There was, however, nothing to call forth the encouraging offer till now. Now, in asking what in the case of four of these medals constitutes a new fruit or vegetable, I feel difficulty in understanding. Whether it is enough that two Apples or Pears, or other fruits, or of Peas, Potatoes, Onions, or other vegetables may be intercrossed, to call or bring such operation within the meaning of the term cross-breeding. Of course, I do not assume that such is the case; but the question is, what do the donors of the medals assume? But if it is intended to invite the products of such crosses as Grapes and Currants, Apples and Pears, Peaches and Plums, Cherries and Crabs, and so on; or of Peas and Beans, Potatoes and Artichokes, Kidney Beans and Broad Beans, and so on, then is the definition of new as applied to either products severely restricted. The *Rubus* family in fruits have given us the most recent of hybrid productions, if really such; but not one is worth a medal. Of vegetables, none of really hybrid breed has been heard of. The nearest approach to such is probably Mr. W. Smythe's cross-bred Dwarf Beans, from the Dwarf Kidney and climbing Scarlet Runner sections. But one wonders whether such products can be classed as "new." It would seem as if the donors of the medals wanted new *kinds* as the product of hybridisation, and not mere new *varieties* as the product of intercrossing varieties.—A. D.

We think that plants resulting from the crossing of "varieties" with the studied intention of raising others distinct from and improvements on, both pollen-yielding and seed-producing parents are eligible, though not chance seedlings from unknown parentage; but we are open to correction. A plant raised by intercrossing a variety of the Dwarf or French Bean (*Phaseolus vulgaris*), an annual a foot high with white flowers—with a variety of the Scarlet Runner (*P. multiflorus*), a perennial of tall twining growth with scarlet flowers, would presumably be a hybrid; but the result of a cross between either of these and a Broad Bean (*Vicia Faba*) would be a bigener.

Reverting to the prizes: if cross-breds or strictly new "varieties," are, as we apprehend, eligible, there ought to be a great display composed of such flowers as Begonias, Pelargoniums, Carnations, Pyrethrums, Delphiniums, Sweet Peas, Orchids, and others in season; also Peas, Beans, Cucumbers, early Potatoes, and Tomatoes, though the date may be too late for many Strawberries and too early for most other hardy fruits, yet Melons, Grapes, and some other kinds grown under glass may be forthcoming. If, on the other hand, only true hybrids are to be regarded as "new," there must be a great limitation of exhibits that can be open to receive the medals in question. The Williams' Memorial medal ought to bring forth interesting and diversified collections of "hybrid and cross-bred plants," as newness is not a stipulated condition.

Under any circumstance the coming Conference will give a great stimulus to further effort in systematic endeavour to raise new and improved products of various kinds in the domain of gardening, and Triennial Conferences (quinquennials may be too slow in these go-ahead days) might be expected to bring together surprising results, also helpful and interested visitors from various parts of the kingdom and other lands.

Chiswick will be highly worthy of a visit on the 11th of next month by all who are interested in the important subjects to be discussed there, and continued in the Town Hall, Westminster, on the following day, while the banquet in the evening, there can be no doubt, will be a brilliant success.

EXAMINATIONS IN HORTICULTURE.

We have received the list of successful candidates, together with the merit marks accorded them by Rev. Prof. Henslow and Mr. James Douglas, the Examiners appointed by the R.H.S. With the

half-yearly index of necessity taking up much space we regret the impossibility of publishing the list, and especially as we have been requested to insert the questions propounded, and which will possess wider interest, as well as stimulate the faculties, especially of young gardeners, in the direction of answering them for themselves, by way of practice for an orthodox attempt another year. They must choose four of the questions in each section, striking the others out, and write answers to the eight questions in two and a half hours, without consulting a book or notes of any kind. This would be good practice. Those who have not hitherto been candidates may, if they wish, send their papers to the Editor, who will inform them of their chances of success in a serious attempt in the future. This was done in the case of some of those who passed in the recent "exam," and who sent stamped directed envelopes for return. The questions are as follow:—

DIVISION A.—ELEMENTARY PRINCIPLES.

1, Compare the structure of a Bean with that of an Onion seed. How do they differ in germination? Describe the peculiar movements which germinating seeds exhibit.

2, What differences exist between the manner and places where rootlets arise from roots, and branches from stems? Of what use are branches, and what trees have none?

3, What hinders the proper functions of leaves, and what should a cultivator attend to, in order to enable them to exercise their complete action?

4, Give any instances of failures, and state your opinion as to their causes, in crossing distinct species. What are the general characteristics of hybrids.

5, What is meant by "fixing" a new race, and how is it to be effected, if possible?

6, Describe the flower of the Pea, of a Primrose, of a Salvia, and of any Orchid; and explain how they are adapted to insect pollination.

7, What are the injurious effects of (i) too much water; of (ii) too great a heat; and of (iii) excessive drought upon plants?

8, To what natural orders do the following plants belong, and why—*Clematis*, *Malope*, *Geum*, *Gunnera*, *Fuchsia*, *Scabiosa*, *Cobaea*, *Amaranthus*, *Ixia*, and *Ruscus*.

DIVISION B.—HORTICULTURAL PRACTICE.

9, What is generally understood in this country by an "American Garden?" Give the names of the most suitable plants for it, and the best kind of soil.

10, What is meant by a "sub-tropical garden?" Describe the best position for such a garden; also the most suitable plants, and how to cultivate them.

11, What is the right width for garden paths and carriage drives? Describe their formation, and the best materials to use.

12, Is it possible to obtain a supply of Roses all the year round from an English garden? Describe their propagation and culture under glass and in the open ground.

13, What are the most useful fruit trees* to grow under glass? Describe the best form of glass structure for the purpose, and the method of culture.

14, How would you proceed to obtain a succession of Garden Peas and Dwarf Kidney Beans? Can they be obtained all the year round? If so, how?

15, What plants are generally grown for salads in British gardens? How may a supply be obtained all the year round?

16, What is the best aspect for a flower garden? How would you proceed to lay it out and stock it?

For answering their own choice of eight of those questions we find that eighty candidates obtained 200 marks and upwards, Mr. Harrington H. Eaton of the County Technical School, Stafford, leading with 285. Fifty candidates received between 150 and 200 marks, bringing them into the second class. Thirty students who obtained over 100 marks were placed in the third class. It is apparent that such questions are only intended for professional gardeners and intelligent, well educated, and persevering amateurs. To attempt to cram the minds of ordinary uneducated workers with the requisite knowledge for answering questions of the above nature would be time and energy wasted. We were preparing a further digest of results when the following communication was received.

COMMENTS ON THE R.H.S. "EXAM."

I have been favoured with a copy of the questions set at, and the results of, the recent R.H.S. examination of candidates for honours in horticulture. It is interesting to note at the outset that there is a material falling off in the number of candidates, as only 165 were presented, as against 190 last year. That is indeed a considerable decrease, and may be said to indicate grave doubts on the part of those

* The word is intended to exclude Vines.

young persons interested in gardening as to the present method of examining being quite fair towards them. Should this ratio of declension be continued for three years, then we may expect a repetition of what happened to the Society of Arts' exams in horticulture thirty or more years ago, when with Dr. Hogg and Thos. Moore as examiners the questions submitted to candidates were far more practical than are those of to-day.

Another unquestioned fact in relation to these present-day exams is that they are fast resolving themselves into battle royals between rival schools, or laboratories, or colleges, for precedence for their respective pupils. Anyone looking over the list of candidates placed in the respective classes will not fail to notice the prominence given to these respective institutions, which, whatever they may do in producing practical and useful gardeners, at least get a good advertisement. Thus Swanley Horticultural College takes the cake with thirty-two placed pupils, Chelmsford Laboratory next with twenty, Holmes Chapel Horticultural School with eleven, and the Stafford Technical School with nine, making a total of seventy-two candidates out of 160 passed. So far as can be seen, there are no other teaching institutions; certainly no other is mentioned. It is a most remarkable fact that the chief national school in practical horticulture—the Royal Horticultural Society's Chiswick gardens—is not credited with a single candidate. Naturally, it may be expected that in establishing this examination the R.H.S. would be the first body to see that its practical school of gardening sent numerous candidates for its own exam. Kew, again, does not send one, unless the candidate residing at Chiswick belongs to one or other of these great gardens.

So far amongst counties that have no horticultural schools, Surrey has usually sent the highest number of candidates. I count this time twenty from that county as having passed—a very good proportion indeed, considering, so far as I am aware, the county sets up no scientific school, such as a few other counties possess. Kent, which in the matter of purely technical instruction in practical horticulture, stands amongst the best instructed of counties, sends other than from Swanley College only two candidates. Evidently the Kent C.C. does not value these exams much. Of the passed 160 candidates, twenty-six are females, and of these twenty-four are from college or laboratory. It may be expected that some of these have, of course, gone in for the exam to gratify their respective teachers; but to assume that Horticulture—written with a capital H—will benefit thereby is absurd.

But what of the questions set? These readers may discuss themselves, as doubtless they will be published. If we look at the first eight, or elementary questions, it is seen that these are almost exclusively of a physiological order; only two, Nos. 3 and 7, having any bearing on practical gardening, and then only in a most limited degree. Nos. 6 and 8 are essentially botanical. It is not difficult to understand that such semi-scientific questions as these are favoured in awarding marks, although they would leave the cleverest of replies still very much wide of sound practice.

In the division allotted to horticultural practice, only one relates to fruit culture, and that under glass, and very limited. Two only relate to vegetables, but these are very good and practical. The question relating to what is an "American garden," is quite out of date. No one refers to American plants or gardens now. Our shrub and hardy plant gardening is far too cosmopolitan for such divisions. In the same way question No. 16 is of no value, because in flower gardens we grow plants that need cool as well as warm aspects. The term "flower garden" is now an enormously wide one.

However, I think I have said enough. To me the product of this annual exam is very disappointing. It fails to provoke general interest evidently, and seems now to be mainly kept alive by the competition of the rival schools.—PRACTICAL.

It must not be taken for granted that we agree in everything that is said by our correspondent. He has evidently examined the matter carefully, and we suspect he knows more of the examinations of a generation ago than we do, nor do we think he was a plucked candidate. The candidates in schools and colleges predominate, as they undoubtedly ought to do, as being specially trained over a long period, yet there is a wider representation of non-schoolmen and collegians than appears in the communication.

The county passes seem to stand somewhat as follows:—Surrey, as stated, 20; Berks 11, Leicester 8, Hants 6, Isle of Wight and Middlesex, 5 each; Dumfriesshire, Lancashire, and Yorkshire, 4 each; Stafford, Hants, and Kent, 2 each; Derby, Gloucestershire, Lincolnshire, and Westmoreland, 1 candidate each.

The numbers, we are convinced, in no sense represent the relative capacities of gardeners in the several counties; and in some of them the best and most useful teaching of its kind is given—notably in Derby and Kent, but is concentrated in meeting the particular

requirements of allotment holders, cottagers, tradesmen, and others, who desire to make the land they occupy, with their home surroundings, as profitable and attractive as possible, and it is gratifying, indeed in some instances wonderful, to see what has been done in those and other counties as the result of such teaching by practical men. Such cases cannot be met by the R.H.S. exams; but many more young gardeners might enter these to their own advantage, though it is of no use disguising the fact that numbers of them decline to do so because of what they regard as "college cramming and competition," though it is really not "competition" at all, as if for prizes, but simply a case of every candidate doing his or her best, and being credited with the results attained.

ADIANTUMS FOR CUTTING.

THE demand for cut Fern fronds for various purposes is enormous, and no matter what steps are taken to insure a continuous supply, there generally occurs some period during the year when hard, ripe fronds are sought for in vain. There seems to be no limit to the amount which could be made use of in large private gardens where much decorative work is done, but when fern is scarce other substitutes have to be found for it, and the force of circumstances often has the effect of showing us that foliage of many kinds may sometimes with advantage be used in the place of fronds of *Adiantum*; but for many purposes these are quite indispensable, and their popularity does not seem likely to wane. *A. cuneatum* and *elegans* are the varieties most largely in demand, and in order to insure a supply of fronds throughout the year it is necessary to work on systematic lines, for if haphazard methods are followed breaks will inevitably occur in the supply.

An excellent plan to pursue is to grow the plants in collections, and never to cut a single frond from a given stock until full development and hardening have taken place; then to pick the fronds as required till all the ripe ones have been removed, and grow the plants again till a successional crop of fronds is ready. From strong plants two crops of fronds may generally be secured in one season. Take, for instance, plants which were repotted during January or February. The first set of fronds produced should have been ready for picking some weeks ago, and as these were secured a succession of young ones ought to be advancing. These, if encouraged to grow, will give good fronds during the end of the summer and autumn, after which the plants ought to be rested by being kept dry at the roots and cool till early spring.

Giving *Adiantums* a season of rest is in reality one of the most important points connected with their culture, for if they are kept growing throughout the year, their fronds being also continuously removed, they do not last long in good condition, but the crowns and fronds gradually get weaker and smaller, till they refuse to grow at all. Each time a frond is picked before it has become hard it tends to weaken the crown. I once knew a gardener who was required to produce a large quantity of Maidenhair Ferns for decorative work during the autumn months. He succeeded in obtaining what was required by a very simple plan, and had good reason to be proud of his plants, which were grown throughout in a cool house, and allowed to complete the whole of their growth before any of the fronds were picked. During the autumn each plant was quite cleared of fronds as they were required for use. Water was then withheld till the spring, and the plants were repotted once in two years. With this treatment bold crowns and good fronds were produced year after year.

The above serves to illustrate an excellent method of culture for securing fronds for cutting in the autumn. To give a supply during spring and early summer a number must be grown in heat, but in each case it is important that the fronds become hard and ripe before being picked, or deterioration will gradually take place. It is not wise to keep plants lingering after they have become stunted. They should instead be consigned to the rubbish heap, and seedlings grown to take their place. These can now be bought so cheaply, or raised at home, that one item in systematic Fern growing is to pot a number of young plants each year, so as to always have some vigorous "young blood" to depend upon.

The season when *Adiantum* fronds are usually extremely scarce is from December till March, but with young plants the difficulty of maintaining a supply then can be surmounted, by procuring strong plants in 3-inch pots during October, potting them in 5-inch ones, and forcing in heat. Good mellow loam, with abundance of fibre, will grow them well without any addition, but so few growers are able to obtain just the right kind of loam that it is usually safer to employ a compost formed of two parts loam, one of peat, with a liberal addition of sharp sand. When the loam is not good mix an equal portion of peat with it, and in all cases pot firmly.

Adiantums delight in a moist atmosphere, but this should be maintained by damping rather than by syringing the plants. They

also thrive much better on an open stage than one covered with spar or ashes; they seem to enjoy having the warmth from the hot-water pipes constantly circulating among them, provided the atmosphere is kept charged with moisture. To grow the plants quickly abundance of heat should be maintained, little air, and a moderate amount of shading given, and when the fronds are fully developed the plants ought to be removed to a cool structure to harden before being picked for use.

Fronds of a rather pale green are the most highly prized, and to secure such no manure of any kind should be given, and shade only when really necessary during the late stages of growth. When a crop of fronds has been cleared from plants in the summertime, those which have young growths starting should be again placed into heat, but any having dormant crowns, if removed to a cool frame, fully exposed to the sun, and kept rather dry at the roots for a month, will often start vigorously into growth when water is more freely given. Such plants supply useful material for cutting in the depth of winter. All Fern fronds should, if possible, be plunged in water for an hour or so before being used, as the practice prolongs their lasting qualities.—H. D.

SEASONABLE NOTES ON FIGS.

YOUNG TREES FOR EARLY FORCING.

THESE must now be in the pots in which they are to fruit, and on no account be neglected. Afford all the light possible, and keep the trees well syringed and supplied with liquid manure so as to insure a clean, sturdy, well-nourished growth. When that is complete they should have abundant ventilation so as to ripen it thoroughly. Stopping must not be practised after this date. When the growth is matured the trees may be placed outdoors in a sunny place, but in dull and wet weather means should be adopted for warding off heavy rains.

EARLY FORCED PLANTED-OUT TREES.

The second crop fruits on trees started at the new year are now a good size, they being about three weeks earlier than usual, and if judiciously thinned there will be a crop of delicious Figs. If the crop is a heavy one reduce to eight or nine fruits of the small, five or six of the medium sized, and three or four of the large-fruited varieties to each square foot of trellis covered by the trees or exposed to sunshine, leaving the most forward at the base of the shoots, which will ripen earlier and attain to greater perfection than those near the points. These parts should be kept free from fruit, and be allowed to grow up to the light. This is necessary to secure well-ripened wood so as to insure a full first crop the following season, the trees being at rest by the middle of October. If the borders have been allowed to get dry they must be watered repeatedly until the soil is thoroughly moistened. Liquid manure will be required by trees having their roots in borders of limited extent, and more frequently than by trees with a large extent of rooting area—about once a week in the first case, and every fortnight in the other—giving thorough supplies, and always in a tepid state. A light mulching replenished from time to time will encourage surface roots, and a sprinkling of artificial manure on the border and washed in will assist the Figs to swell.

Syringing will be needed daily, except in dull wet weather. If red spider gain a footing, it must be dislodged by syringing the trees with an insecticide; and scale should be removed by using a brush. Painting the hot-water pipes with sulphur is an effectual remedy for red spider, the pipes being heated to 170° to 200° for about an hour, and the house kept close. Artificial heat will not now be necessary unless the weather suddenly become cold and wet, then sufficient only to maintain a night temperature of 60° to 65°, and 70° to 75° by day. Ventilate early, especially on clear days; and close sufficiently early to run up to 85° or 90°, or even 95° to 100°, providing plenty of atmospheric moisture.

SUCCESSIONAL FIG HOUSES.

When the fruit gives the least indications of ripening by changing colour afford more air, insuring a circulation constantly by keeping the top and bottom ventilators open a little. Reduce the atmospheric moisture gradually, and expose the fruits as much as possible to the full influence of light and air. Lessened supplies of water will be needed at the roots, but they must not be allowed to suffer. If red spider be troublesome a thorough washing may be given the trees after the fruit has been closely picked, and this repeated each time the fruit is gathered will keep the pest under until the crop is cleared, when more effectual means can be adopted for its eradication. It must be done early on a fine day, and the water be soft, clear, and tepid, otherwise the Figs may be discoloured, and acquire a musty flavour.

TREES SWELLING THEIR CROPS.

A light mulching of short manure acts as a source of moisture, nourishment, and surface rooting. When the roots are active they can be fed to any extent with top-dressings of phosphoric and potassic manures, but care must be taken not to unduly excite growth. A handful per square yard of five parts dissolved bones, two parts powdered saltpetre, and two parts ground gypsum mixed will assist Figs to mature heavy crops of fruit, and make sturdy, healthy, fruitful wood. Syringe twice a day in fine weather, always early in the afternoon, closing the house at the same time, and so as to gain enough sun heat to rise to 90° or 100°. The fruit will then swell to a good size, and rest being assured at night by allowing

the temperature to fall to a safe minimum, the trees will be capable of performing a long day's work.

LATE HOUSES.

Trees against walls covered with glass often grow rampantly, and root-pruning affords little better results as regards fruit, because the trees are too far from the glass. In such cases it is better to allow them to grow up with one stem or more to the roof and then train the growths to a trellis about 1 foot from the glass and down the slope. The sun then shines into the points of the shoots, and they push Figs at nearly every joint. Keep the growths thin, stop at the fifth leaf, and mulch and water the borders. Ventilate early, and utilise sun heat by early closing, feeding according to the requirements. The trees will ripen one crop in August, and the second crop Figs being removed and the shoots allowed to grow to the light so as to get their points well ripened, a full crop may be relied on another year.—GROWER.

ROSE SHOW FIXTURES IN 1899.

- JULY 1st (Saturday).—Crystal Palace (N.R.S.).
 " 4th (Tuesday).—Gloucester and Harrow.
 " 5th (Wednesday).—Brockham, Ealing, Hanley*, Hitchin, Reigate (Redhill), and Tunbridge Wells.
 " 6th (Thursday).—Colechester (N.R.S.) and Farningham.
 " 7th (Friday).—Hereford.
 " 8th (Saturday).—Manchester.
 " 11th (Tuesday).—Reading and Wolverhampton.†
 " 13th (Thursday).—Bedale, Brentwood, Eltham, Helensburgh, Norwich, and Woodbridge.
 " 14th (Friday).—Ulverston.
 " 15th (Saturday).—New Brighton.
 " 19th (Wednesday).—Cardiff*, Newcastle-on-Tyne.†
 " 20th (Thursday).—Salterhebble and Sidcup.

 " 25th (Tuesday).—Tibshelf.

AUG. 3rd (Thursday).—Liverpool ‡

* Shows lasting two days. † Shows lasting three days.

‡ Show lasting four days.

—EDWARD MAWLEY, *Rosebank, Berkhamsted, Herts.*

ROSES GENERAL SCHABLIKINE AND MARIE D'ORLÉANS.

WE have the pleasure to send for your inspection blooms of the above Rose, of which mention is made at page 473 of the Journal of June 8th. This Rose has been in our collection (and in our catalogue) for some years past, so if any of your readers wish to try it they need not send to the south of France for it. In the neighbourhood of Cannes it is without doubt one of the most attractive of the red Tea Roses, but we have never seen it superlatively good out of doors here, and we do not remember its attracting the attention of any of the hundreds of visitors who have seen the plants at various times during the blooming season. Possibly, like Papa Gontier and others of the Riviera Roses, it requires the special climatic conditions of the South to develop its full beauty. According to our experience the best for outdoor cultivation of the red or rose coloured bush Tea Roses that have come to us from the Riviera is Marie d'Orléans. This is hardy, of vigorous growth, and wonderfully profuse in yielding large, well-shaped flowers.—W. PAUL & SON, *Waltham Cross.*

[We are very much obliged to Messrs. Wm. Paul & Son for the bouquet of General Schablikine. This Rose was highly extolled by Lord Brougham, whose observations are recorded in the Dean of Rochester's new book, "Our Gardens," from which we cited them, together with the statement that the Rose could only be had from its raiser in France. This was evidently a mistake. The variety is described by Messrs. W. Paul & Son as "one of the most attractive of the red Tea Roses." To us it is more suggestive of a floriferous China Rose. The opening blooms are decidedly attractive, being rich reddish pink, changing to rosy pink, and still paler on full expansion. They are the most beautiful when young, and when associated with the small dark leafage, and numbers of buds in various stages, have a charming effect in a drawing room vase. The fresh young blooms would be also excellent for gentlemen's coats or ladies' sprays. We can imagine that a solitary and comparatively small plant or two would not arrest particular attention, but a group of a dozen flowering like the sprays before us, could scarcely fail to be admired, while flowers for cutting would be afforded over a very long period; still the preference of Messrs. Wm. Paul & Son for Marie d'Orléans must not be overlooked. Roses of this character are rapidly increasing in public favour, both for the adornment of gardens and the embellishment of rooms.]

GIGANTIC ASPARAGUS.

I HAVE been much interested in the particulars given by "W. G.," on page 491, June 15th, of the large Asparagus sold by Mr. Howell at Birmingham, and grown at Evesham. Asparagus is largely and well cultivated in that part of Worcestershire, and the area devoted to its culture increases each year. Many hundreds of acres of Asparagus are grown within a radius of four miles of Evesham, and it has become one of the most important crops of the district.

On reading the paragraph above referred to I asked myself this question: Did the bundles contain the exact number of 100 heads, as printed, or did they contain the usual Evesham market gardener's "hundred?" which is a distinction with a very great difference, his "hundred" of Asparagus being not less than 120 heads.

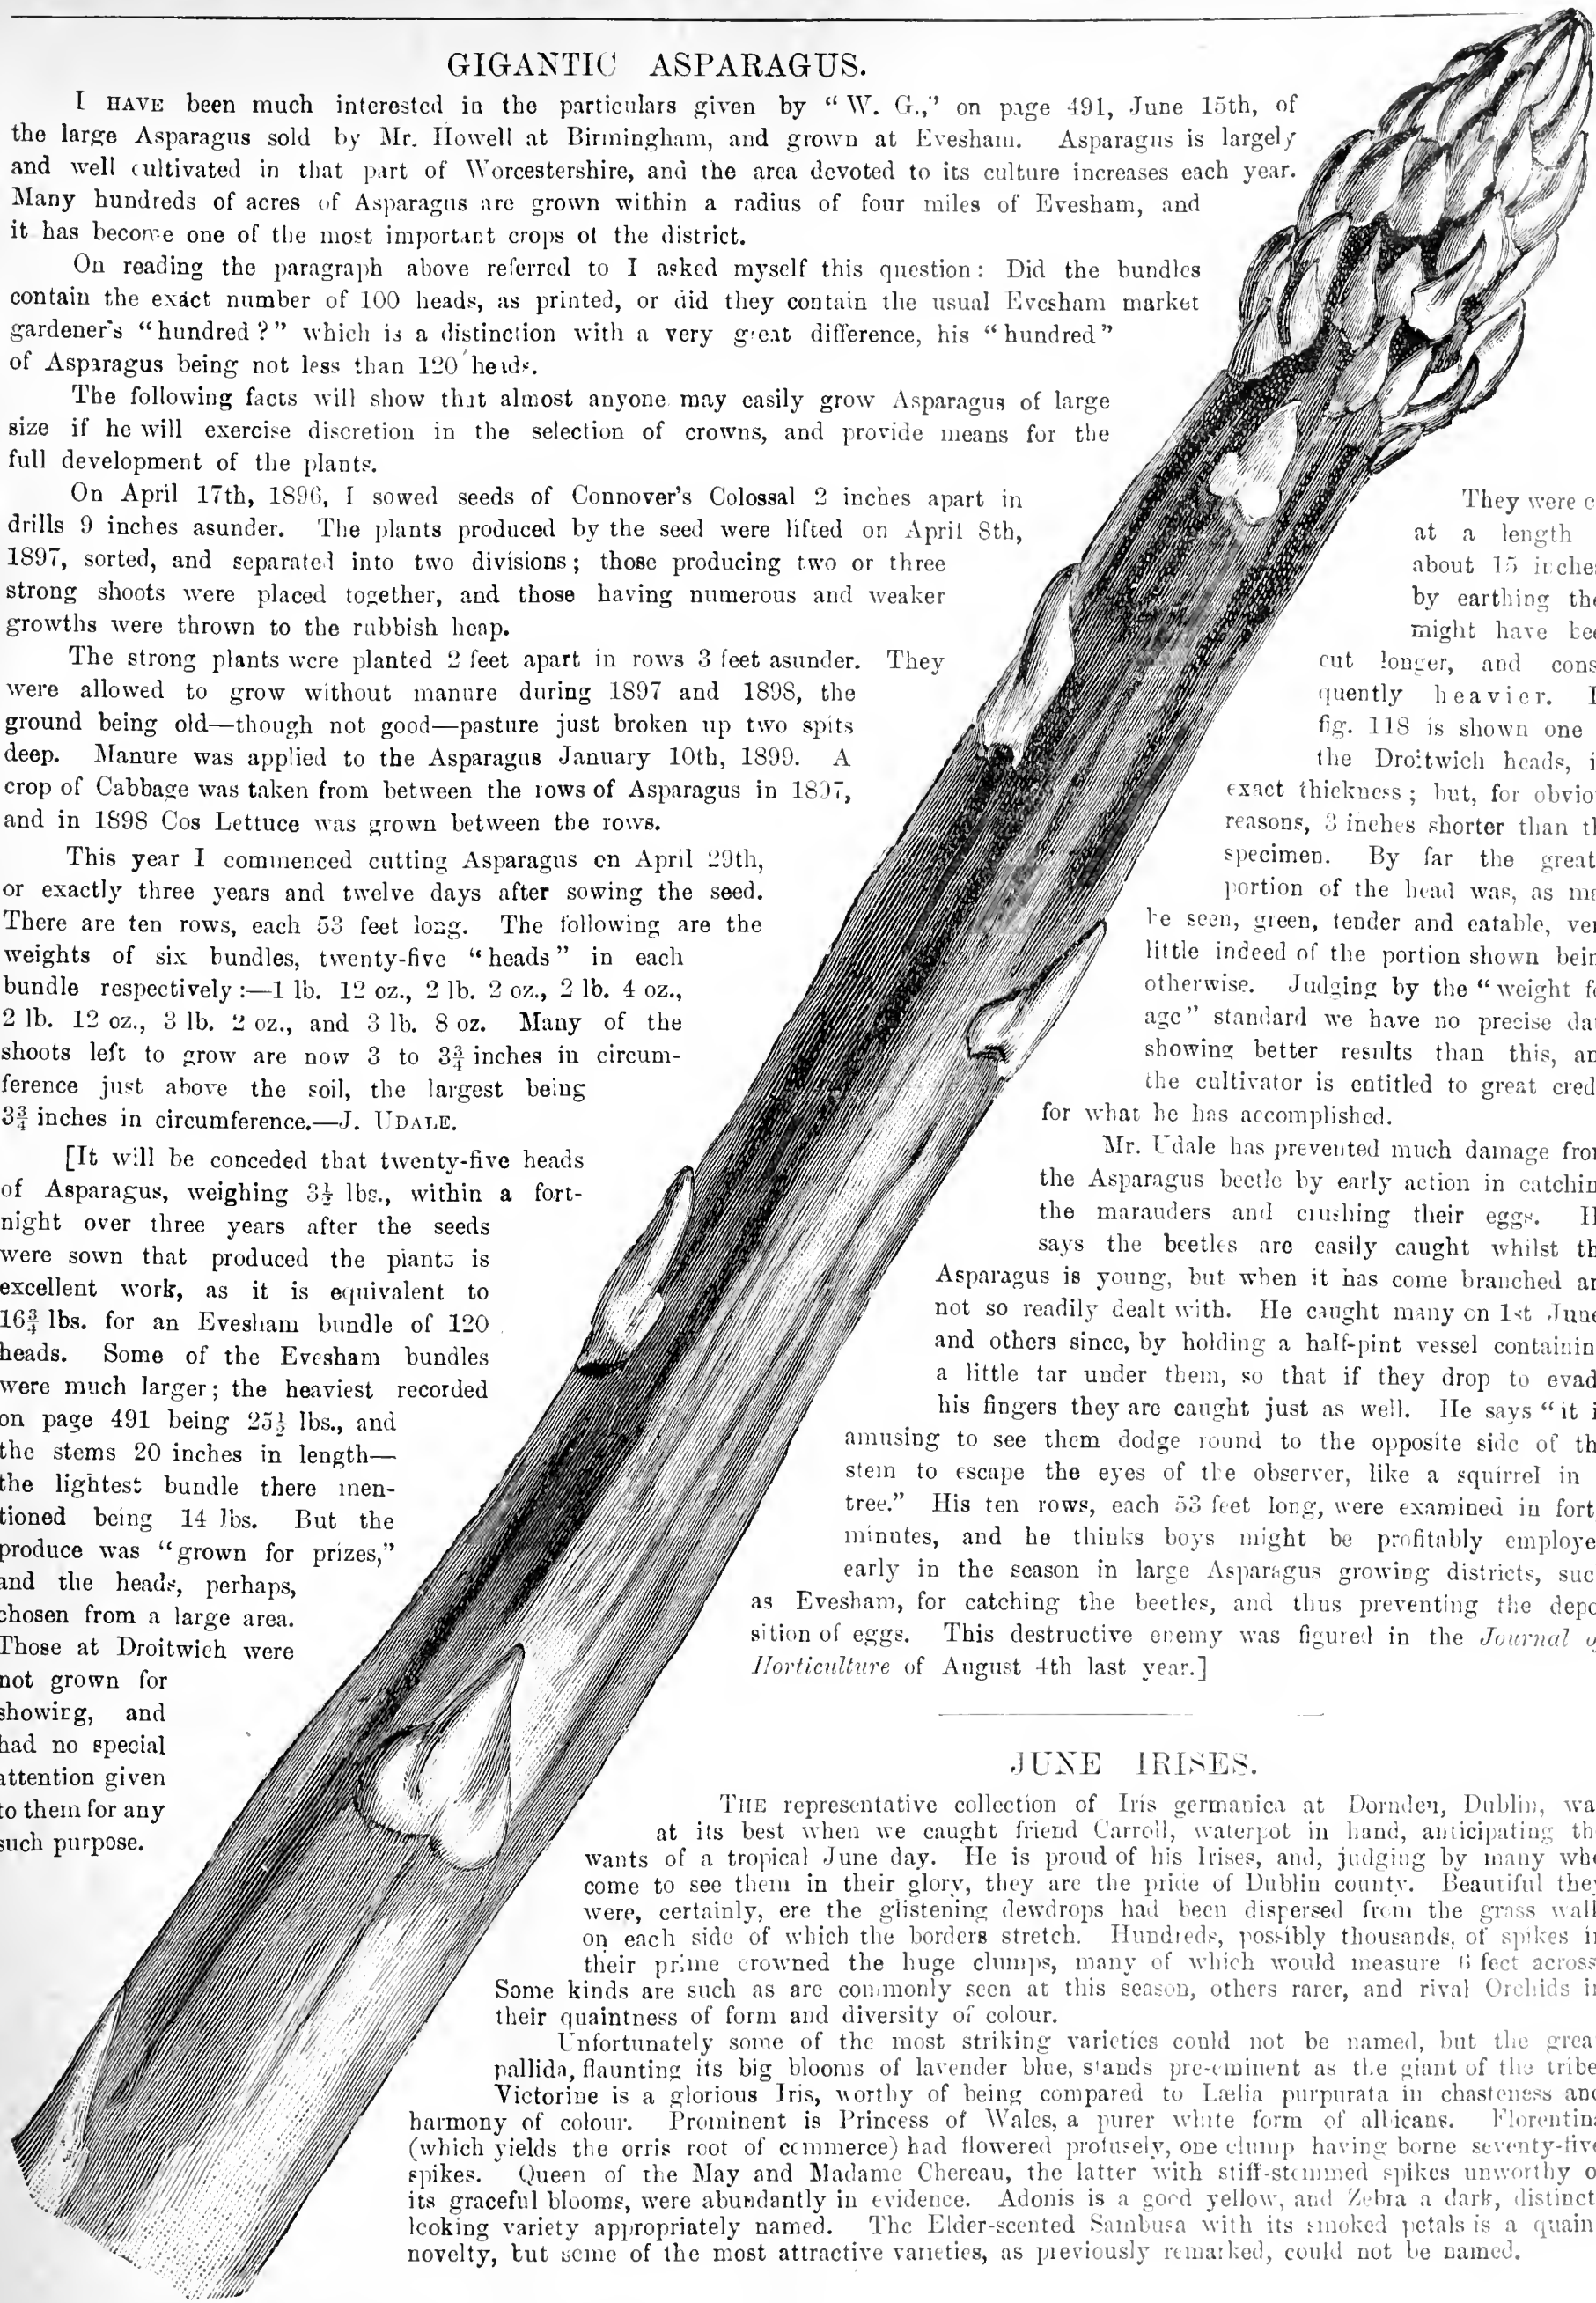

The following facts will show that almost anyone may easily grow Asparagus of large size if he will exercise discretion in the selection of crowns, and provide means for the full development of the plants.

On April 17th, 1896, I sowed seeds of Conover's Colossal 2 inches apart in drills 9 inches asunder. The plants produced by the seed were lifted on April 8th, 1897, sorted, and separated into two divisions; those producing two or three strong shoots were placed together, and those having numerous and weaker growths were thrown to the rubbish heap.

The strong plants were planted 2 feet apart in rows 3 feet asunder. They were allowed to grow without manure during 1897 and 1898, the ground being old—though not good—pasture just broken up two spits deep. Manure was applied to the Asparagus January 10th, 1899. A crop of Cabbage was taken from between the rows of Asparagus in 1897, and in 1898 Cos Lettuce was grown between the rows.

This year I commenced cutting Asparagus on April 29th, or exactly three years and twelve days after sowing the seed. There are ten rows, each 53 feet long. The following are the weights of six bundles, twenty-five "heads" in each bundle respectively:—1 lb. 12 oz., 2 lb. 2 oz., 2 lb. 4 oz., 2 lb. 12 oz., 3 lb. 2 oz., and 3 lb. 8 oz. Many of the shoots left to grow are now 3 to 3½ inches in circumference just above the soil, the largest being 3¾ inches in circumference.—J. UDALE.

[It will be conceded that twenty-five heads of Asparagus, weighing 3½ lbs., within a fortnight over three years after the seeds were sown that produced the plants is excellent work, as it is equivalent to 16¾ lbs. for an Evesham bundle of 120 heads. Some of the Evesham bundles were much larger; the heaviest recorded on page 491 being 25½ lbs., and the stems 20 inches in length—the lightest bundle there mentioned being 14 lbs. But the produce was "grown for prizes," and the heads, perhaps, chosen from a large area. Those at Droitwich were not grown for showing, and had no special attention given to them for any such purpose.]

They were cut at a length of about 15 inches; by earthing they might have been cut longer, and consequently heavier. In fig. 118 is shown one of the Droitwich heads, its exact thickness; but, for obvious reasons, 3 inches shorter than the specimen. By far the greater portion of the head was, as may be seen, green, tender and eatable, very little indeed of the portion shown being otherwise. Judging by the "weight for age" standard we have no precise data showing better results than this, and the cultivator is entitled to great credit

for what he has accomplished.

Mr. Udale has prevented much damage from the Asparagus beetle by early action in catching the marauders and crushing their eggs. He says the beetles are easily caught whilst the Asparagus is young, but when it has come branched are not so readily dealt with. He caught many on 1st June, and others since, by holding a half-pint vessel containing a little tar under them, so that if they drop to evade his fingers they are caught just as well. He says "it is amusing to see them dodge round to the opposite side of the stem to escape the eyes of the observer, like a squirrel in a tree." His ten rows, each 53 feet long, were examined in forty minutes, and he thinks boys might be profitably employed early in the season in large Asparagus growing districts, such as Evesham, for catching the beetles, and thus preventing the deposition of eggs. This destructive enemy was figured in the *Journal of Horticulture* of August 4th last year.]

JUNE IRISES.

THE representative collection of *Iris germanica* at Dornden, Dublin, was at its best when we caught friend Carroll, waterpot in hand, anticipating the wants of a tropical June day. He is proud of his Irises, and, judging by many who come to see them in their glory, they are the pride of Dublin county. Beautiful they were, certainly, ere the glistening dewdrops had been dispersed from the grass walk on each side of which the borders stretch. Hundreds, possibly thousands, of spikes in their prime crowned the huge clumps, many of which would measure 6 feet across.

Some kinds are such as are commonly seen at this season, others rarer, and rival Orchids in their quaintness of form and diversity of colour.

Unfortunately some of the most striking varieties could not be named, but the great pallida, flaunting its big blooms of lavender blue, stands pre-eminent as the giant of the tribe. Victorine is a glorious Iris, worthy of being compared to *Lælia purpurata* in chasteness and harmony of colour. Prominent is Princess of Wales, a purer white form of allicans. Florentina (which yields the orris root of commerce) had flowered profusely, one clump having borne seventy-five spikes. Queen of the May and Madame Chereau, the latter with stiff-stemmed spikes unworthy of its graceful blooms, were abundantly in evidence. Adonis is a good yellow, and Zebra a dark, distinct-looking variety appropriately named. The Elder-scented Sambusa with its smoked petals is a quaint novelty, but some of the most attractive varieties, as previously remarked, could not be named.

Away from the Iris borders proper was noticed an Iris species with tough, leathery, strap-shaped leaves (not in bloom) yielding a pronounced odour of beef; and a fine clump of the Plum-scented Iris *prismatica* bore its blooms modestly concealed in a thicket of long, narrow foliage. Many a charming alpine or hardy shrub was in bloom and beauty; but, satisfied for the nonce with a walk and talk through the Dornden Irises, we "biked" back to breakfast.—K.

RECENT WEATHER IN LONDON.—A return of hot weather to the metropolis is not generally appreciated, and on Monday and Tuesday the heat was intense. In the afternoon of the former day it was particularly oppressive. On Wednesday morning it was close and dull.

— A SHOREDITCH PLAYGROUND.—A small plot of ground in Ivy Street, Shoreditch, was recently opened, and the thickly populated district obtains a recreation ground. The area is one fifth of an acre, and the London County Council paid £2100 for it. A few small shrubberies have been made, but the rest of the land has been paved and will be used as a gymnasium. The cost of the necessary work and apparatus is £920.

— DEATH OF MR. T. W. GIRDLESTONE.—Everyone will be sorry to hear that Mr. T. W. Girdlestone of Sunningdale, very well known to rosarians, and also as President of the Dahlia Society, died on Sunday of the complaint named appendicitis, sinking after an operation undertaken to relieve the pain from which he was suffering. Mr. Girdlestone's name is well known outside horticultural circles, as his school at Sunningdale was one of the great nurseries for Eton, Harrow, Charterhouse, Winchester, and other public schools. He was so universally popular amongst his old pupils that his unexpected death will be a great blow to them and his many friends, who, I may say, are scattered over the whole world. At one time Mr. Girdlestone was a very frequent writer on gardening topics, more especially on Roses, of which he was one of the keenest and best judges, and so close an observer of their individual peculiarities that, in fact, he is said to have been able to tell the names of rare plants by their foliage. His articles were always interesting and replete with information, and since he gave up writing there have been very few who could rival him in the clear way he was able to impart knowledge of great practical use, or in the interest he gave to the subject of Rose growing. At one time he was a frequent and very successful exhibitor, but of late years had given this branch of Rose culture up, and had devoted himself more particularly to the cultivation of Dahlias, in which flowers he took the greatest interest. His death, at a comparatively early age, in the prime of life, and the full tide of his usefulness, leaves many of us lamenting a friend who had so many interests in common with us, that we feel his loss to be irreparable. R.I.P.—CHARLES J. GRAHAME.

— AN OLD HYBRIDIST.—I trust that our ancient friend, Mr. Robert Fenn, will have more tangible results after his serious and loyal ceremony of "committing to earth" than usually results to such proceedings. Interesting as was the Sulhampstead function, especially in its element of loyalty, we may not assume that the event in relation to Mr. Fenn's horticultural work by any means comprised the only act of a long and earnest life. Few men, professional or amateur, and he is essentially of the amateur order, have devoted more time to intercrossing, cross-breeding, or hybridisation so far as the Potato is concerned than he has. His latest effort, crossing *Solanum Fendleri*, a species I believe never before utilised for the purpose in this country, with a garden Potato, the old International Kidney, is of a piece with other efforts, and previously he has utilised *Maglia* in the same way. Still, so far these efforts have only resulted in the production of garden Potatoes, and possibly the product of the more recent cross will come to the same thing. But if anything should tend to produce a new strain, then the most recent cross should result. The desire to secure some absolute disease-resisting stock is the primary cause for the work still proceeding. During a long life Mr. Fenn has crossed and intercrossed literally scores of varieties, and at one time succeeded in quite revolutionising our Potato stocks. His labours never have received the notice or reward they deserve. Many men have obtained honours and awards with far less reason. But our octogenarian friend is modest, and I fear in spite of his efforts will not be one of the recipients of the hybridisation memorial medals.—A. D.

— ROYAL BOTANIC SOCIETY.—On Wednesday, June 21st, the annual floral fête was held in the Society's Gardens. There were a May-pole dance, a pastoral play, and military music. The gardens were effectively illuminated in the evening. The horticultural exhibitors included Messrs. Barr & Sons, A. W. Young & Co., J. Prewett, and G. W. Piper.

— DEATH OF MR. JAMES ANDERSON.—It is with regret that we have to record the death of Mr. James Anderson, who passed away at Glasgow on June 16th, in his sixty-eighth year, after a protracted illness. The deceased was for many years gardener to T. Dawson, Esq., Meadowbank, Uddingstone, N.B., after whose demise he established himself as a landscape gardener. Mr. Anderson was editor of the "Northern Gardener."

— LATE BROCCOLIS.—In thanking "South Yorks" and "H. B." for their notes respecting late Broccolis, I observe that the former introduces us to a comparatively little known variety southwards in June King. Does this differ from Methven's June or from Ledsham's Late White, or Sutton's Late Queen, or Veitch's Model? How much I should like to see a simultaneous trial of these assumed distinct varieties! Only at the recent meeting what was sent as a new variety came before the Fruit Committee at the Drill Hall, but a sample of another late variety, presumably Late White, was found superior. I hope an effort will be made to give us a good trial of these Broccolis shortly. No doubt in South Yorkshire large pots are common; certainly those fine 10-inch heads would need ample pot room. I hope the Editor's acknowledged pair of heads from Leicestershire are not quite such pot-bursters.—A. D.

— PLOW OR PLOUGH.—As our esteemed and versatile colleague, Mr. A. H. Pearson, has committed himself to the old Biblical and new American method of spelling plough as plow, will he also define its proper pronunciation? Now, if he employs the words blow, glow, slow, flow, and many others ending in "low," he will not find the pronunciation at all harmonising with plough or "plow," as pronounced generally. In all the above words the final, a "w," is unused. Will Mr. Pearson speak of "plo," or will he somewhat inconsistently adhere to the common pronunciation of plough or "plow?" The English language, in relation to its immense number of inconsistencies of pronunciation, is a very hard nut for the foreign student to crack. As Mr. Pearson is becoming a phonetic reformer *re* spelling, will he also reform pronunciation by calling plow plo?—D.

— A CHANNEL FLEET.—Such is the title given to a booklet that has been edited and published by Mr. Percy Lindley, 30, Fleet Street, for the Great Eastern Railway Company. This route to the Continent becomes more popular each year, for the simple reason that, as Mr. Lindley has it, one finds "Comfort, Celerity, and Cheapness," three C's which go far towards one's peace of mind when crossing the sea. The pamphlet, in addition to interesting letterpress, contains a number of illustrations showing the exterior and interior of some of the ships in the Company's splendid fleet, as well as scenes in Holland, Germany, Norway, Denmark, and Switzerland, all of which countries are expeditiously served by the G.E.R. boats. Copies of the booklet may be obtained from Mr. Lindley as above, or the Continental Department, G.E.R., Liverpool Street Station.

— DRILL HALL MEETINGS.—No one seems to have anticipated seeing such a show as was that found at the Drill Hall on the 13th inst. Everybody had thought that the Temple Show had so far exhausted the energies of trade and other exhibitors that there would have been a poor display. So far from that being the case, the show was a remarkably good one, the hall being well filled. What tributes are these shows at once to the popularity of the Society and to that principle of honorary showing. The old Metropolitan nurseryman, who used at luncheons and dinners, when the toast "The Exhibitors" was proposed, remark, "You've only to find good prizes, gentlemen, and we'll make good shows," would, perhaps, be surprised could he revisit the physical world to see what wonderful shows can be made without prizes. Exhibitors may claim that the Fellows and visitors at the R.H.S. gatherings should be deeply indebted to them, and that is true. But the obligation is not one-sided, for generally exhibitors, because of the publicity given to their products, and the not inconsiderable business done in consequence, get a fair reward. We saw evidence of that the other day, when a very fine group of plants was purchased as they stood to be sent out to Vienna. We see here illustrated what is a pretty well known fact, that for horticulture of the broadest and highest excellence Great Britain stands first amongst nations, and the R.H.S. has done wonders in helping to create that high position.—OBSERVER.

The weather during the week has been generally dull, with cool winds. No rain fell between May 24th and June 18th.

— RAIN AT LAST.—Although at this moment of writing, June 22nd, the rainfall has not been great, it has been most acceptable and refreshing. We had begun to cry out over the drought, although it had lasted only a few weeks, and did not for one moment compare in duration with what we had to withstand last year. But there can be no doubt but that in the South of England at least drippy weather in May and June suits best. Once get good growth on crops, then they can withstand summer heat very well. But whilst there has been much lamenting over drought, and praying, not particularly reverently, for rain, our crops have generally suffered more from the long spell of cold endured in May and early in the present month, and sharp frosts, than from lack of moisture. No doubt those engaged in haymaking will cry out if much rain falls, but we are a growling race.—WANDERER.

— ROYAL METEOROLOGICAL SOCIETY.—The last monthly meeting of the present session was held on Wednesday afternoon the 21st inst., at the Society's new rooms, 70, Victoria Street, Westminster. Mr. F. C. Bayard, L.L.M., President, in the chair. Dr. R. H. Scott, F.R.S., read a paper on the heavy falls of rain recorded at the seven observatories connected with the Meteorological Office during the twenty-eight years, 1871–98. The data has been derived from the records of the Beckley self-recording rain gauges at the following places: Valencia, Armagh, Glasgow, Aberdeen, Falmouth, Stonyhurst, and Kew. These records have been tabulated for each hour, and it is from these hourly tabulations that Dr. Scott has extracted the heavy falls. He finds that Falmouth has the greatest frequency of heavy falls, the next station being Valencia, and then Stonyhurst. The most exceptional fall during the whole period was at Glasgow, at 5 P.M., on August 11th, 1895, when as much as 0.80 inch was collected in ten minutes. The information given in this paper is likely to be of much service to engineers who want to know the rate at which rain sometimes falls in short periods. A paper by Mr. J. Baxendell, describing his new self-recording anemoscope, was read by the Secretary. A paper by Mr. R. C. Mossman, F.R.S.E., on the average height of the barometer in London, was also read by the Secretary.

— POSOQUERIA LONGIFLORA.—The majority of people have a partiality for white flowers, and in most instances they like those that are sweetly scented. The blossoms of this charming old stove plant are both, and it is a wonder it is not more grown. The leaves are deep green, the blossoms tubular on fine corymbs, being at the first glance a little like those of Bouvardia Humboldtii or B. jasminoides. Like these, too, the trusses when cut are rather apt to drop about, but on the plant they last well, as they do when taken off singly and placed in water. P. longiflora may be easily propagated by means of cuttings made of young flowerless shoots, which should be inserted around the sides of pots filled with a light sandy compost, and well drained. Frequent pinching while still in a young state induces the formation of nice bushy plants, these having a far prettier effect when in flower than when allowed to grow shapeless, and with long vigorous shoots taking the lead from others. A warm greenhouse or stove temperature is best for it all the year round, and the atmosphere must be kept moist, otherwise insects are apt to be troublesome. The pots used should be small rather than on the large side, and when well rooted the plants are greatly benefited by frequent applications of weak soot water.—H. BURY.

— KIDDERMINSTER AND DISTRICT HORTICULTURAL SOCIETY.—The usual monthly meeting of this newly formed Society, which now numbers over 150 members, was held on the 14th inst., when a paper on the "Cultivation of the Carnation, Border and Malmaison," was given by Mr. W. H. Wilson of Moor Hall, Stourport, under the chairmanship of Rowland Hill, Esq., of The Firs, a Vice-President of the Society. Mr. Wilson's lecture was very instructive and practical, containing most valuable hints on the growth and general treatment of this lovely flower. His remarks were the more highly appreciated as he is well known as an extensive and successful cultivator of the Carnation. At the conclusion votes of thanks were passed to Mr. Wilson for his lecture, and to the Chairman for presiding, and all expressed the wish that this paper was but the commencement of a series of similar papers to be given by Mr. Wilson.—T. J. R.

— ONIONS AND MAGGOTS.—Under this heading Mr. J. Shalford gives some excellent cultural hints (page 487), and under such circumstances it is not to be wondered at that he obtains bulbs good enough to draw praise from his "kitchen genius." But I think he has let his pen run away with him a little when he decries sowing in boxes except for the production of exhibition bulbs. All my main crop Onions are sown this way, and as far as this garden is concerned I find that I save time, seed, and ground, and at the same time get better crops than if I sowed outside in the usual way. Boxing has, in my case at least, been the means of setting the maggot at defiance. Again, sparrows have no chance with boxed plants, and here, unless the beds were netted, they would take the lot. Circumstances alter cases, and though, as Mr. Shalford has been careful to show, in his garden sowing in boxes is unnecessary, I can assure him that with me it is just the other way, and I could never be sure of getting a good bed under the older system. He is wise to follow the plan that gives him the least trouble and at the same time such excellent results.—H. R. RICHARDS, Coldham Hall, Bury St. Edmunds.

— FORMING LOW-BRANCHED TREES.—Some fast growing trees get finally too tall for the purposes for which they were originally planted. Through the winter season, when employment for cutters is scarce, the axe and saw are vigorously plied to head back these trees. It is thought this is the proper method to make the trees throw out wide-spreading branches. Any careful observer may see this is never accomplished. The butchered tree only endeavours to go up more rapidly than before. If this topping were to be done, says "Meehan's Monthly," late in spring, or in early summer, when the tree is in mature leaf, and starting to grow vigorously, the effect would be very different. The growth force is not sleeping at that period as it is in the winter season, but in active operation. The force intended to be expended in the upward growth must exhaust itself somewhere. Suddenly checked in its upward course, it is diverted into the lateral branches, which are strengthened accordingly. The caretaker of hedges, or, as they have come to be termed with us, live fences, understands this very well. He cuts back the strong shoots at the apex severely, and thus manages to have the hedge as thick at the bottom as at the top. Unfortunately, the tree-butcher is usually at his day's work in the summer time. It is only under the starvation stress of the winter season that he whispers in the owner's ear that his trees need pruning.

— THE RIGHT TIME TO SPRAY.—In the use of all the poisons for destroying the insects of trees and bushes and plants a great deal of the success depends upon doing the spraying at the right time. Usually the insects must be caught just before emerging from the eggs or when they emerge from the bud or leaf. Spraying at this critical time will prevent further multiplication, and will save trouble and expense. Early spraying is thus essential to effective work. While the fruit trees are nearly all sprayed in summer, an early spring application is quite necessary. This is made to forestall the fungi, scab, blights and moulds that will inevitably appear in early spring. Some insects must be attacked before the leaves appear to be killed at all. One cannot always decide whether the trees are being attacked by insects, but if on a hasty examination signs of their presence are apparent, the safest course is to take the matter immediately in hand. If the insects or diseases are allowed to get such a headway that they are troublesome, it is almost impossible to make up for lost time. When a blight takes such a hold that the leaves and bark begin to lose colour and strength, it will not be an easy matter to check the spread of the disease in time to save much of the fruit. Often the diseases do not make their full appearances until summer, but the spores and germs have been sown and are working out their mission of destruction in spring, and they can only be headed off by spraying before the buds unfold.—A. B. BARRETT (in "American Cultivator.")

CAMELLIAS AT ST. LEONARD'S HILL.

AS one sees garden after garden in various counties one realises more and more how vastly they differ from each other in their essential features. This may be characterised by its magnificent Rhododendrons, that renowned for its historical associations, a third celebrated for its Orchids, still another for its unique arboricultural treasures, and so on. And it is this constant change that maintains the interest of innumerable visits, and makes one ever anxious to explore "fresh fields and pastures new." Fortunately there is no lack of beautiful homes and gardens that are worthy of prominent recognition in the pages of the *Journal of Horticulture*, so that the taste for such travel is not likely to be soon quenched. That the popularity of gardening in our island home is ever increasing cannot be doubted, and this notwithstanding the fact that the number of immense estates that are fully maintained is smaller than was the case a generation, or less, ago.

In the particular instance now under observation—St. Leonard's Hill, Windsor, the residence of Sir Francis Tres Barry, Bart., the member of Parliament for the royal borough—the specialty is Camellias out of doors. Not that these noble plants form the sum total of this charming estate. By no means, but they are of such super-excellence, and so unique a feature, that to them full prominence must be accorded in these notes, and even then too much in their praise will not be said. Probably visitors to the spring meetings of the Royal Horticultural Society at the Drill Hall will remember the collection of cut Camellia flowers that was staged from St. Leonard's Hill by the gardener-in-chief, Mr. R. Brown, when forty-two distinct varieties were represented, though all were not named. At the first glance there was nothing remarkable in the exhibit, but closer investigation revealed the fact that every one was from plants—or, rather, bushes—grown out of doors. The expression to Mr. Brown of a wish to see them at home was no sooner hinted than a hearty invitation was given, and prompt arrangements were made, which culminated in a journey to Windsor on Thursday, April 20th. Happily the day was fine and dry, for it is perfectly certain that so much pleasure would not have been derived had the weather proved unpropitious.

At the outset it may be stated that the planting of Camellias out of doors was commenced by the gardener acting under the express wish of Sir Francis, then Mr. Barry, some seventeen years ago, and the two original plants now occupy the positions in which they were first placed, and flower year by year. The object in view was to prove the constitution of the plants to be sufficiently hardy to withstand, with no semblance of protection, the extremes of our climate. It must be said that these were planted close to the mansion in such a position as to be wholly protected from the north by the structure, and largely sheltered from the east by an angle of the building. The identical spot is almost at the extreme left-hand corner of the photographic reproduction (fig. 119). No attempt was made to plant wholesale at this period, but the much wiser course of "marching slowly" was adopted, and ultimately with gratifying results, as may be seen by every visitor at any time of the year. The initial effort was so full of promise that successive work was soon proceeding, though still tentatively. However, as years rolled on, and it was seen that the severity of the frost made no appreciable difference to the health and strength of the stock the number of plants became greater and greater until it now reaches a total of upwards of 150 specimens, ranging from youngsters a foot in height to those that have grown old in faithful service, but are yet young in the vigour of their growth, and in the abundance of their flowers.

Probably some readers of these notes who are accustomed to seeing Camellias carefully protected under glass will assume that St. Leonard's Hill is a peculiarly favoured estate as regards shelter, and does not suffer from severe frosts at all. Such a supposition would be entirely erroneous, as the beautiful mansion, which alone is worthy of a detailed description, is wholly exposed to the north, east, and west, and is protected from the south by trees only. It stands on high ground that permits the visitor, when on the terrace, to look over Old Windsor to the Royal Castle, which occupies a lower eminence some two or three miles away. In one respect it is more than likely the elevated position favours the growth of the Camellias, as it is well known that frosts of equal severity, so far as the actual number of degrees registered is concerned, are followed by vastly different effects at the summit of a hill and at its base. The drier air of the higher elevation causes the frost to be much less disastrous. But if we grant a point in favour of the situation from this aspect of the case, we must, in all justice, take into consideration the frost-laden winds that come with biting keenness from north and east almost, if not quite every year, and never do the plants the slightest harm. There they are at the present moment planted on the north, east, and west aspects, and the experience of nearly twenty years has proved them to be equally hardy with Rhododendrons and other shrubs that are supposed to have sufficient natural strength to stand safely anywhere.

It will have been observed that so far no mention has been made of the susceptibility or otherwise of the flowers themselves, but that the remarks have been strictly applied to the plants. This was done advisedly. The blooms and buds that are actually beyond the cover of the foliage turn brown on the visitation of frost, and are useless. But, on the other hand, each bud that is protected by the leaves remains uninjured, and

when we consider that some of the plants produce upwards of 500, it will be admitted that the loss of a score or so does not necessarily mean that the beauty of the specimen has gone for a season. One could hardly realise the protection that the leaves provide until they had been examined. This shows them to be very thick and of an exceptionally tough character. The amount of frost they are capable of resisting must be very great, though we are not prepared to assert that they would escape Professor Dewar's 421°. In colour the leaves are deep green, and whereas when Camellias are grown under glass it is frequently found that the leaves are turned the wrong way round, on these outdoor plants an occurrence of this nature is exceedingly rare. Then someone may ask, Is the soil of such a character as to be extremely favourable? And I should be inclined to reply in the negative, as it is a strong, holding loam, in which it is difficult to establish any plants, but which provides good food when once the roots have a firm grip. Mr. Brown, however, does not plant in this direct, but employs heavy dressings of leaf mould and grit, these in conjunction favouring rapid root action, and consequent quick establishment of the stock.

Camellia growers under glass, too, have to cope with one very considerable source of trouble, and that is bud-dropping. We have all read much in the *Journal* of late relative to Peaches and Nectarines casting their buds, and it is to a large extent the same with Camellias, though in the one case the cultivator strives for fruit and in the other for flowers only. Unless in each case the utmost attention is constantly given to the plants the buds will inevitably fall, and it cannot be doubted that it is a cause of much worry to gardeners. With the St. Leonard's Hill Camellias Mr. Brown has no trouble on this head, as the buds never drop except, as has been stated, through exposure to frost. They hold on with great tenacity, and the fully developed flowers show no tendency to fall on the least provocation, as is the case with tenderer indoor blooms. Indeed, they scarcely call for the use of wire, though no doubt this is employed to make certain positive, if such an expression will be permitted. Just as the leaves are stout and tough, so are the petals, of which the colours are excellent, though liable to be marred, if not spoiled, by rain drops.

Another point worthy of consideration is the dimensions to which the plants have attained since they have been out of doors. In dealing with this aspect of the case latitude must be permitted as the positions occupied largely govern the stature and diameter of the bushes. For example, the tallest is about 10 feet high, but as it is rather cramped for space in a shrubbery, it loses in breadth what it gains in height. The fairest test then will be a plant in the open, and the finest is probably of the variety *imbricata rubra*, which is 6 feet 6 inches high, and 8 feet in diameter, and carried this year over 500 blooms fully expanded at one time. No one surely could wish to see a grander sight. This particular bush is fourteen years old, and would be from a foot to 18 inches high at planting. Of the two original specimens one is the well known *conspicua*, which is 7 feet high by 8 feet in diameter, but this it will be remembered is in an angle of the mansion. It is wholly a question of position and not of variety, as all alike of the half hundred sorts represented flourish satisfactorily. All the names cannot be given, indeed such a course would be impossible, as many have never been so distinguished; but in addition to those referred to, *imbricata alba*, Morse's white, very fine; *alba plena*, *L'Insubria*, *Eclipse*, Countess of Orkney, and *tricolor* may be enumerated, and these must suffice.

From the plants in various situations in the grounds flowers are cut from February to June, but the profusion comes during March and April, and in May commences to diminish, until in the midsummer month the blooms become very scarce. Such, too, is the case in February, when only a rare flower in some peculiarly protected position can be secured. But it is certain that for upwards of two months no plants could produce a more charming display, or awaken so much interest as do the Camellias out of doors at St. Leonard's Hill. Just a word of advice to those who would experiment in the same direction, and we must pass on. Let the planting be done in April, the stock having been kept in a cold structure through the winter, and prior to any growth having been made, so that the new shoots may be produced entirely out of doors. These will be quite hardy, while growths made before planting might succumb. The plants for a time look rather shabby, as many of the leaves turn brown, but they soon recuperate, and become a source of pleasure to everyone. After establishment an annual top-dressing of leaf mould will be found beneficial.

Of the vegetables and fruit, both out of doors and under glass, mention cannot be made in these notes, but the Coniferous trees are so excellent that they must not be overlooked. The collection is comparatively extensive, and is rich in variety, some of the specimens being particularly handsome. For example, the not too often seen *Stone Pine* is splendid, as are *Picea nobilis* and *pinsapo*, with *Abies lasiocarpa*, *Douglasi*, *Albertiana*, and *concolor*. Then, too, there are beautiful examples of *Cupressus lawsoniana* and *C. L. aurea*, as well as *Thuia aurea* and *Thuiodium dolabrata*. *Araucaria imbricata* is grand, and a beautiful *Taxodium distichum* graces the pleasant lawn. Of forest trees, Oaks and Beech stand pre-eminent, and are very numerous. Because the Rhododendrons and the Azaleas, the hardy and tender flowers and the utilitarian portion of the estate, are not particularised, it must not be assumed that they are unworthy. As a matter of fact, they are as good in their way as the Camellias, for Sir Francis Barry is too genuine a horticulturist to neglect the garden generally simply to favour one particular plant.

notwithstanding his deep interest in the Camellia and the success that has crowned his efforts in growing it. The few hours spent with Mr. Brown at St. Leonard's Hill were usefully employed, for they taught me much with which I was not previously acquainted, as well about other flowers as Camellias.—H. J. WRIGHT.

ROYAL HORTICULTURAL SOCIETY.

DRILL HALL.—JUNE 27TH.

ONCE again the resources of the Drill Hall were taxed to the utmost to find accommodation for the exhibits. This pressure was of course largely accentuated by the Rose Show which was held at the same time. It cannot be doubted, however, that even in the absence of the Roses the Hall would have been full, as numerous exhibitors had to have their

collection of fruit, comprising good bunches of Black Hamburgh and Foster's Seedling Grapes, Strawberries, Melon, Peaches, and Nectarines.

Messrs. Jas. Veitch & Sons, Chelsea, exhibited a basket of Strawberries, Veitch's Prolific, a very free cropping variety, also a box of ripe fruits of excellent flavour. Mr. H. Pettigrew, gardener to Lord Windsor, Redditch, staged two Melons, named Lord Hanwell and Rigmaden Park.

Messrs. Laxton Bros. sent two baskets of Strawberries, Monarch, a variety now well known, and Mentmore, a cross between Noble and British Queen; the fruits are large, a good shape, with deep colour, but as they were labelled "not to be touched," the Committee passed no remarks on them. Mr. W. Allan, gardener to Lord Suffield, Gunton Park, exhibited fruits of Melon Gunton Scarlet, a variety of excellent flavour, which, we believe, received an award of merit, though this is not recorded on the official list; and Mr. M. Taylor, gardener to Lord Llangattock, Nannerch, sent fruits of a new Tomato, Klondyke, which appeared prolific. Mr. T. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth,

FIG. 119.—ST. LEONARD'S HILL.

space reduced, while others had to be declined. Pressure on our space compels our giving a condensed report, notwithstanding the excellence of the products shown.

FRUIT COMMITTEE.—Present: P. Crowley, Esq. (in the chair); with the Rev. W. Wilks, and Messrs. J. Cheal, G. Reynolds, W. Poupart, A. F. Barron, E. Shaw Blaker, J. H. Veitch, A. H. Pearson, A. Dean, S. Mortimer, H. Balderson, G. Wythes, G. T. Miles, W. Bates, F. Q. Lane, J. Willard, R. Fife, J. Wright, and W. Gleeson.

Messrs. T. Rivers & Son, Sawbridgeworth, exhibited some Peach trees in pots that had been forced continuously for eight years, and it is doubtful if finer specimens have ever been exhibited; they were not only laden with fruit, but the latter were large and well coloured. The varieties were Sea Eagle and Thomas Rivers. The same firm also staged a collection of fruits in boxes, which included Thomas Rivers, one fruit of which was upwards of a foot in circumference, Princess of Wales, Grosse Mignonne, and Gladstone Peaches, Victoria and Byron Nectarines. Plums were represented by The Czar, while Elton, Frogmore Bigarreau, and Early Rivers Cherries completed a magnificent exhibit.

Mr. W. J. Prewett, gardener to C. A. Pearson, Esq., Farnham, staged a

staged a splendid collection of Queen Pines; the fruits were individually excellent, and constituted a fine exhibit.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); with Messrs. J. Fraser, C. T. Druery, R. Dean, T. Peed, J. F. McLeod, J. Fraser (Kew), C. Jeffries, C. E. Shea, G. Gordon, J. Walker, H. J. Cutbush, E. Beckett, E. T. Cook, E. H. Jenkins, C. J. Salter, D. B. Crane, and E. Mawley.

The most striking exhibit in the Show was the group of miscellaneous flowering and foliage plants from Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, Herts. The diversified plants were splendidly grown. There were the customary foliage plants, with Liliums, Carnations, Ericas, Crimson Rambler Roses, Hydrangeas, Gladiolus Colvillei The Bride, Tuberoses, and Spiræas. Messrs. J. Peed and Son, Norwood, contributed a display of tuberous-rooted Begonias, including single and double varieties in diverse colours. The backbone of Messrs. W. Paul & Son's collection of Roses from Waltham Cross was composed of about thirty-six distinct Moss Roses. Such a number a most interesting exhibit, particularly as it was somewhat out of the common. Unfortunately, just before noon, the tabling gave way,

and visitors were therefore prevented from seeing the full beauty of the collection. Other Roses were utilised to complete the group. Mr. H. Walters, Eastwell Park, Ashford, Kent, showed Carnation Lady Gerard.

Messrs. Dobbie & Co. sent from Orpington some excellent Sweet Peas, but space was so limited that they had to be closely packed together, thus practically destroying the good effect. All the best varieties were shown. Messrs. Parr & Sons, Covent Garden, were represented by hardy herbaceous flowers, Pæonies being most conspicuous. These were brightly beautiful, and comprised single and double flowers. Messrs. R. Wallace and Co., Colchester, had Liliums, Calochorti, Irises, and other hardy flowers in attractive variety. Messrs. Kelway & Sons, Langport, staged some magnificent spikes of Delphiniums with Pæonies and Gaillardias. A fragrant group was that from Messrs. H. Cannell & Sons, Swanley, as it comprised fifteen varieties of Stocks. A background of excellent Aquilegias showed up the fine spikes of the Stocks.

Messrs. G. Jackman & Son, Woking, exhibited cut Roses and hardy flowers, and made a bright display. Mr. H. B. May, Upper Edmonton, showed a very fine collection of Selaginellas, including fifty species and varieties. Messrs. Paul & Son, Old Nurseries, Cheshunt, arranged a group of Pæonies, but here again sufficient space was not available, and individual varieties could not be properly distinguished. Messrs. J. Veitch and Sons, Ltd., Chelsea, staged some grand plants of Canterbury Bells, with beautiful cut flowers of Pæonies, Irises, and Gladioli. Mr. J. Russell, Richmond, sent diversified trees and shrubs, which came as a pleasant relief for the eye after the brilliance of the flowers. Mr. J. Fleming, gardener to Sir C. Pigott, Bart., Wrexham Park, Slough, sent Crotons with splendid plants of *Humea elegans*. Messrs. B. S. Williams & Son, Upper Holloway, arranged a small group of Carnations.

Messrs. W. Cutbush & Sons, Highgate, showed some excellently grown Malmaison and border Carnations backed by Bamboos and fringed with Ferns. Calla Elliottiana was also represented. Mr. F. G. Foster, Brockhampton, sent Sweet Peas in close bunches. The varieties were well diversified. Mr. M. Prichard, Christchurch, contributed *Orchis foliosa*, *Philadelphus Lemoinei erectus*, *Kniphofia caulescens*, with *Nymphæas* and *Nepeta Mussini*. Mr. J. Douglas, Great Bookham, exhibited Carnations that were characterised for quality rather than quantity. Messrs. Watkins & Simpson, Exeter Street, Strand, showed a collection of dwarf Lantanas. Messrs. J. Veitch & Sons staged *Escallonia langleyensis* grandly flowered, *Styrax japonica*, *Cæsalpinia japonica*, *Abelia triflora*, *Philadelphus microphyllus*, and *Retinospora obtusa alba Mariesi*.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); with Messrs. J. O'Brien, H. Ballantine, C. Winn, W. Cobb, J. Colman, H. T. Pitt, G. Hill, J. G. Fowler, A. H. Smea, H. M. Pollett, W. H. Young, W. H. White, J. Douglas, S. Courtauld, de B. Crawshay, H. Little, A. Outram, H. J. Chapman, J. Jaques, J. T. Gabriel, and T. B. Haywood.

Messrs. J. Veitch & Sons, Ltd., Chelsea, occupied their customary position on the Orchid table, but did not show a very large group. Cattleyas and Lælias formed the backbone of the display. Messrs. B. S. Williams & Son, Upper Holloway, contributed a group of Orchids, in which *Cypripediums*, Lælias, *Odontoglossums*, and Cattleyas were conspicuous. Mr. W. Whiffen, gardener to J. Bradshaw, Esq., The Grange, Southgate, sent a bright little group, the effect of which would have been improved by the addition of a few small Ferns. Messrs. H. Low & Co., Bush Hill Park, showed Orchids, Cattleyas being particularly fine, as was a flower of *Cypripedium callosum* Sanderæ.

Mr. Walters, gardener to Lieut.-Colonel Shipway, Grove House, Chiswick, showed a few Orchids in creditable condition. Messrs. Stanley Mobbs & Ashton, Southgate, sent a bright group of Orchids. Mr. W. H. White, Orchid grower to Sir Trevor Lawrence, Bart. Dorking, showed *Catasetum fimbriatum superbum*, *Cattleya Mossiæ Lawrenceæ*, *Lælia tenebrosa atrata*, and *Odontoglossum crispum purpurascens*. Mr. H. Cooke, gardener to de Barri Crawshay, Esq., Sevenoaks, sent *Odontoglossum crispum Cherubim* and *O. c. Seraphim*. Exhibitors of a few plants of Orchids, in addition to those named, were numerous.

MEDALS.—Fruit Committee.—Silver-gilt Knightian medal to Messrs T. Rivers & Son; silver Knightian medal to Mr. T. Coomber; and bronze Banksian medal to C. A. Pearson, Esq. Floral Committee.—Silver-gilt Flora medal to Mr. E. Beckett; silver-gilt Banksian medal to Mr. J. Fleming; silver Flora medals to Messrs. J. Veitch & Sons, W. Paul and Son, and R. Wallace & Co.; bronze Flora medals to Messrs. F. G. Foster, Watkins & Simpson, Dobbie & Co., Jackman & Son, and H. Cannell and Sons; silver Banksian medals to Messrs. H. B. May, Cutbush and Son, M. Prichard, Kelway & Son, and Barr & Sons; bronze Banksian medals to Messrs. Paul & Son and J. Russell. Orchid Committee.—Silver Banksian medals to Messrs. J. Veitch & Sons, H. Low & Co., J. Bradshaw, and S. Mobbs & Ashton.

CERTIFICATES AND AWARDS OF MERIT.

Carnation Lady Gerard (H. Walters).—A large flower, pale cream in colour. The petals are broad, but the flower is scentless (award of merit).

Carnation Trojan (J. Douglas).—The petals of this white variety are well-nigh perfect, as is the form of the flower (award of merit).

Cattleya Eudora eximia (J. Veitch & Sons).—A superb Cattleya, and undoubtedly one of the finest varieties of Eudora that has ever been shown (first-class certificate).

Cattleya Gaskelliana formosa (J. Veitch & Sons).—A delicately beautiful Orchid. The colour over all is very pale bluish. There is a touch of purple in the centre of the lip, and the throat is yellow (award of merit).

Cattleya Mossiæ Lawrenceæ (W. H. White).—This is a charming form. The sepals and petals are white, as is the fringed margin of the lip. The central portion is pale purple-rose, and the side lobes yellow (award of merit).

Davallia Illustris (J. Veitch & Sons).—A graceful Fern, whose broad, light green, much-divided fronds are carried on stout footstalks, about 18 inches high (first-class certificate).

Delphinium Sir Walter Scott (Kelway & Son).—A magnificent spike of large flowers. The colour is purple and royal blue (award of merit).

Dracana indivisa Schneideri (J. Veitch & Sons).—A plant that is sure to attain great popularity. The leaves are dark green, with a crimson midrib; they are about 15 inches long (first-class certificate).

Lælia tenebrosa Victor Warburton (A. Warburton).—The sepals and petals are chrome yellow, the lip being white on the front lobe, and crimson rose on the centre and side lobes (award of merit).

Lælio-Cattleya Dominiana Fire King (Mrs. Briggs-Bury).—One of the handsomest varieties that has been exhibited; the colour is exceptionally rich (first-class certificate).

Masdevallia Rushtoni (G. C. Hincks).—An upright-growing hybrid, that resulted from a cross between *M. racemosa* and *M. ignea Eckhautei*. The colour is orange, with rich crimson veins (award of merit).

Odontoglossum crispum purpurascens (W. H. White).—A splendidly shaped flower. The ground is white flushed purplish rose, and having numerous brown spots (award of merit).

Odontoglossum crispum Seraphim (De Barri Crawshay).—A magnificent pure white variety; it is probably one of the best that has been staged (first-class certificate).

Odontoglossum Harryano-crispum (W. H. Young).—A superb hybrid between the parents named. The sepals and petals are white edged rose, and with immense blotches and spots of bright brown. The magnificent lip is of similar colour (first-class certificate).

Pelargonium Fire Dragon (E. S. Towell).—A peculiar flower, resembling a Cactus Dahlia in shape. The colour is brilliant scarlet (award of merit).

ODONTOGLOSSUM ADRIANÆ ASHWORTHIANUM.

ON Tuesday, June 13th, Mr. H. Holbrook, gardener to E. Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire, exhibited at the Drill Hall *Odontoglossum adrianæ ashworthianum*, to which a first-class certificate was recommended by the Orchid Committee of the Royal Horticultural Society. The spike carried three flowers, one of which is represented in the illustration (fig. 120). The flower depicted is of natural size. The form of the flower is perfect, and the spotting on the whole surface of exceptional beauty. The ground colour is white, but this is almost obscured by the numerous light brown spots and occasional blotches. The variety thoroughly deserved the high award, as it is far superior to the type.

ODONTOGLOSSUM CRISPUM AUGUSTUM.

In the collection of Orchids that Mons. Jules Hye, Leysen, sent to the Temple Show, there were several plants of more than average merit; but one, *Odontoglossum crispum augustum* (fig. 121), stood out in conspicuous beauty. It is, as a matter of fact, amongst the handsomest of the dark spotted varieties of this beautiful Orchid, and it is certain to attract a great amount of attention on the comparatively rare occasions on which it is exhibited. As may be seen in the woodcut, the flower is of considerable size, and has immense blotches on sepals, petals, and lip. These are chocolate in colour, and show up splendidly from the white ground. *O. c. augustum* received a first-class certificate from the Royal Horticultural Society some years ago. It will be remembered that Mons. Hye was awarded a gold medal on this occasion for his plants, which were somewhat closely packed into a glass case.

ONCIDIUMS.

There is probably no more useful genus of Orchid than *Oncidium*s, as the flowers in many cases are singularly beautiful, and there are members of the genus flowering in every month of the year. Although the different plants show much variation, there is such a strong family likeness that it is usually easy to determine whether a plant belongs to the genus or not. From the immense branching panicles of tiny flowers produced by *O. divaricatum*, for instance, to the long wiry peduncle and single large flower of the Butterfly *Oncidium*, *O. lapilio* and *O. kramerianum* is a far cry, yet anyone experienced in Orchids could tell them at a glance as *Oncidium*s.

Of quite a different calibre is the pretty *O. cucullatum* and its many varieties, as *O. c. nubigenum* and *O. c. phalenopsis*, and these in their turn are distinct from the section containing such plants as *O. tetrapetalum* and *O. pulchellum*. The showy Brazilian kinds, with the *O. crispum* habit comprise many beautiful species that not

only make a fine display, but last in flower over a very long season. In the cool house, scandent flowered group, it is only necessary to name the popular and beautiful *O. macranthum* and its many allies.

Few other genera can be said to contain such varied and useful species, and as by far the larger number of these are of easy

FIG. 120.—ODONTOGLOSSUM ADRIANÆ ASHWORTHIANUM.

culture no other is to be so strongly recommended to the amateur or beginner in Orchid culture. Coming as they do from such a wide expanse of country no system of procedure can be laid down for all alike, but notes on the most popular kinds frequently appear in the *Journal of Horticulture*. Geographically, *Oncidiums* cover very much of the same ground as *Epidendrums*, and in Linnæus' time the few species then known were classed, as were all known exotic kinds, in the latter genus.—H. R. R.

TROPÆOLUM SPECIOSUM.

I WAS in a wonderfully lovely Surrey garden recently, one I may not name, where *Tropæolum speciosum*, the famous Flame Flower, had beside the north wall of the mansion and in other places become a weed, and gave no end of trouble to keep it restricted. It was a few years since established by planting roots. I brought away some pieces of root and growth, and have planted them in my back yard beneath a north fence, but fear I may not induce it to grow; the change, from a sweet sandy loam in a very lofty garden in the purest air, to our Kingston atmosphere is so great. In the country garden on nets hung on wires fixed to the walls the stems will run up to a height of 15 feet and become a glorious mass of scarlet flowers. It is evident, judging by this case, that given shade, cool temperature, suitable soil, and a sweet atmosphere the Flame Flower is not difficult to establish by roots.—A. D.

I HAVE been interested in the various notes on this beautiful creeper lately appearing in your columns. I have never had any difficulty in establishing it in shady places in the south (Mid-Sussex). On several occasions I procured roots from a parson's garden about two miles from the sea in Banffshire, where the gardener, thirty years ago, had more than he wanted of it, speaking of it as "that confounded weed." On receiving the roots I cut or break them into pieces about 2 or 3 inches long, and lay them on the soil in 5-inch pots two-thirds filled, and cover with an inch of soil. The pots are stood in any cool house or frame and kept moist. They will, treated thus, appear above the soil some weeks earlier, and should have some twigs placed in the pots for them to cling to. I place out early in May, the plants then generally being 6 or 8 inches above the soil. Some that were treated in this way last spring grew to the top of a 9 foot wall (north aspect), and bloomed in September. Last year's growth survived the winter and started afresh 4 and 5 feet from the ground, and in a short time will be a mass of bloom.

Some few pieces of roots planted by the side of my cottage last March are only now making their appearance, which shows what an advantage there is in giving them a start in pots. My experience is that this plant does best in a free, open soil, and where there is no danger of stagnant water about its roots.—R. I.

"FAMILIAR WILD FLOWERS."—This useful book has now reached midstream, and we still find the same general excellence in text and coloured plates. Parts 12 and 13 comprise Yarrow, Charlock, Forget-me-not, yellow Loosestrife, Coltsfoot, Stonecrop or Wall Pepper, Feverfew, yellow or Mountain Poppy, Wall Pennywort, Pimpernel, Corn Marigold, Kidney Vetch, Saintoin, Nipplewort, common Rock Rose, Moneywort, Field Scabious, yellow Water Lily, Meadow Saxifrage, and Thrift.

SHOWS.

OXFORD.—JUNE 20TH.

THE annual show of the Royal Oxfordshire Horticultural Society was held in the beautiful gardens of Trinity College. Instead of single or sets of specimens, groups covering a specified number of superficial feet have been substituted this year in the framing of the Oxford schedule, and appear to meet the popular taste. The plants, flowers, and fruit filled two large tents, representing an area of something like 5000 superficial feet of staging space, the whole of the vegetables being ranged outside on the shady side of the south lawn. The exhibition was regarded (says the "Oxford Chronicle") as altogether superior to any held in recent years, the non-competitive exhibits greatly conducing to that end.

Among the specially noticeable productions was the 180 feet of tabling filled with rare and choice plants from the Chelsea nurseries of J. Veitch & Sons, the collection embracing good examples of Gloxinias, the yellow *Calla Elliottiana*, *Acalypha hispida*, *Caladiums*, *Dracænas*, *Streptocarpus*, *Crotons*, *Nidulariums*, and *Orchids*, first-class certificates being awarded to a collection of blooms of the *Rhododendron javanico-jasminiflorum*. The above were included in the group to which a very high cultural commendation was awarded. Messrs. Tucker & Sons staged several floral designs, and were commended; the Oxford Fruit and Nursery Company, wreaths and other designs of cut flowers, and Messrs. Perry, Banbury, exhibited bouquets and wreaths. Messrs. E. Webb and Sons showed Sweet Peas arranged in neat vases. Mr. C. Turner, Royal Nurseries, Slough, sent a collection of named seedling border Carnations, securing a cultural commendation. Mr. T. Whillans, Blenheim Palace Gardens, presented Malmaison Carnations, and a seedling variety named Oxford Yeoman of a deep crimson colour. A double white tuberous *Begonia* was staged by Mr. F. Clarke, gardener to Mr. M. Wooten, Cross Ways, of a snow white colour, circular outline; an attractive flower raised by the exhibitor.

In the competition open to all England, the groups of stove and greenhouse plants, arranged for effect, proved centres of much attraction, the allotted area, 220 feet, being tastefully set out with rare and valuable plants, the £12 prize going to Mr. Cypher, Cheltenham, whose arrangement comprised a large central *Kentia*, surrounded by Bamboos, neat *Cocos*, *Aralias*, and finely coloured *Crotons*, the outer portions of the design forming four arches, on which were arranged *Orchids* and fine-foilage plants, with a groundwork of Ferns, *Orchids*, *Crotons*, and *Tuberose*s. The second prize group, from Leamington, was well furnished with choice plants, and possessed a large amount of artistic skill. Groups of *Orchids*, filling 72 feet superficial, were immensely attractive, Mr. Cypher leading, the chief kinds being *Lælias purpurata* and *tenebrosa*, *Cattleyas Mendeli* and *Mossiae*, *Oncidium sarcodes*,

FIG. 121.—ODONTOGLOSSUM CRISPUM AUGUSTUM.

Odontoglossum crispum, *O. Pescatorei*, *Miltonia vexillarium*, and *Dendrobium Dalhousianum*. Mr. Bever's second prize exhibit was a lovely collection of choice forms.

The displays of Roses were generally admired, the taste observable in the group sent from Blenheim Gardens being most noteworthy. The second and third cards fell to very attractive arrangements largely composed of Tea Rose buds. Tuberous *Begonias* were shown best by Mr. Johnson of Garsington, whose group, covering 96 superficial feet, was notable for the general good quality of the blooms and bright colours. The tables "decorated and laid as for dinner" proved a good class, the premier arrangement, having a miniature *Cocos* as a centre, pale rose-coloured Sweet Peas and grass with trailing *Smilax*; the second card went to a very showy design, its centre a neat feathery *Cocos* set in a mound of *Orchid* blooms, Rose buds, and Fern fronds; the third prize being a pretty arrangement of yellow Spanish Iris.

In the members' classes, the groups of plants arranged on 120 feet superficial proved much more attractive than did the sets of six specimens of past years. There were three good groups, the premier coming from Mr. W. Bastin, Buscot Park, and contained Carnations Germania, Edith Pope, and W. Robinson, whilst among the Orchids was a very fine piece of *Oncidium sphacelatum*, Palms, Ferns, and decorative plants forming the groundwork. Messrs. Walker, Thame, and Johnson, Garsington, were strong with single and double Zonal "Geraniums," their specimens being healthy and full of flower. Fuchsias were limited to one exhibit of six plants from Mr. J. Mattock, who staged tall pyramidal well-flowered plants; and the exotic and hardy Ferns were equal, if not superior, to those usually seen at the large shows of June. Gloxinias were represented by three collections of six varieties, those from Headington Hill bearing large flowers of exquisite beauty. The specimen plants included an immense example of *Phormium tenax*, *Bougainvillea glabra*, Palms, and a showy plant of *Anthurium* furnished with several dozen spathes. The four groups of Carnations were quite a feature, and though each was good in its way, the Malmaisons from the Blenheim gardens were particularly noteworthy.

Among the cut flowers specimen Roses have lost none of their charm, the boxes of Tea-scented from Longworth Rose Farm, and New Headington Rosery contained very fine specimens. Mr. Prince was placed first for twenty-four and eighteen varieties of Teas; in the latter class he had large blooms of Innocent Pirola, Mons. Furtado, A. S. Gray, Mrs. W. J. Grant, white Maman Cochet, Caroline Testout, Hon. Edith Gifford, Rubens, Princess of Wales, Madame Cusin, The Bride, Souvenir de S. A. Prince, Souvenir d'un Ami, Souvenir d'Elise Vardon, The Bride, Madame de Watteville, and Anna Ollivier.

Bouquets and ladies' sprays were well represented. Zonal "Geraniums" in triplet trusses made a brilliant display, and Pyrethrums were well represented. The old-fashioned florists' Pink has no class provided for it at this show, but a stand of a seedling white Pink was staged from Bradwell Grove, a large form, evidently of Mrs. Sinkins.

Fruit, though not an extensive feature, was an excellent display. For white Grapes Foster's Seedling took the cards, while for black the Hamburgs were awarded the three prizes. Strawberries Royal Sovereign were selected as deserving all the honours, being berries of immense size and well coloured. Peaches were Bellegarde and Royal George, and Elruge and Lord Napier proved the ripest forms of the Nectarines. Melon Sutton's Jubilee took first prize, Beauty of Syon second, and Hero of Lockinge third. Only one dish of Cherries was in competition. These were Governor Wood, and hailed from Maiden Erlegh Gardens.

Vegetables were simply a grand show in themselves, there being no less than seventeen collections of from six to eight varieties in each, including the finest Cucumbers, Tomatoes, Potatoes, Peas, and Carrots ever seen at a June show in this district. Amateurs are generally discounted owing to the vagaries of the season, but the productions staged by them were of good average quality.

SHANKLIN.—JUNE 21ST.

THE annual exhibition of Roses, in connection with the Isle of Wight Rose Society, was held at Shanklin on Wednesday, June 21st. The number of entries was in excess of last year; whilst the standard of excellence was superior to that of any previous season.

The prizewinners in the open classes were, for twenty-four Roses, distinct varieties, Messrs. B. R. Cant, first; G. Prince, second; and Prior and Son, third. Twelve distinct Teas or Noisettes, Messrs. F. Cant & Co., first; B. R. Cant and G. Prince, equal second. Eight distinct, three trusses of each, Messrs. G. Prince, first; D. Prior, second; and F. Cant and Co., third. Twelve of any one variety, Messrs. G. Prince, first; B. R. Cant, second; and Paul & Son, third. Twelve bunches of garden Roses, Messrs. Paul & Son, first; B. R. Cant, second; and F. Cant and Co., third.

Miss Carter, Mr. R. E. West, and Rev. G. E. Jeans were the principal prizewinners in the classes open to all amateurs, whilst in the Isle of Wight classes Mr. J. Lee-White, E. Cowes, secured the cup for twenty-four distinct Roses, and from the same stand he obtained the silver medal for the best H.P. with Mrs. Sharman Crawford, and the silver medal for the best Tea with Medea. For the latter bloom he also obtained the I.W. Horticultural Improvement Association's certificate for cultural merit. Mr. J. Lee-White was also successful in gaining the Queen's gold medal for twelve distinct Roses. Mrs. Croft-Murray, Ryde (gardener, G. H. Kent), was successful in winning the silver-gilt medal for twelve distinct Teas.

The other successful exhibitors in the Isle of Wight classes were Lady Hammond Graeme (gardener, Mr. B. Grist), Rev. G. E. Jeans (gardener, Mr. A. Hill), Mr. J. O. Brook (gardener, Mr. W. Spragg), Miss Carter (gardener, Mr. G. Kent), Mrs. Mainwaring (gardener, Mr. W. Burden), Lady Daly (gardener, Mr. G. Honeybourne), Rev. C. W. Heald (gardener, Mr. H. Chiverton), Rev. A. T. Richardson (gardener, Mr. F. Carben), and Mr. Geo. Williams.

For table decorations Mrs. Kent was first and Miss Gordon second. Mr. B. R. Cant was successful in obtaining the I.W. Horticultural Improvement Association's certificate for cultural merit with Rose Gustave Piganeau. Mr. G. Prince obtained a certificate for a new or rare variety with Alexander Hill Gray, a Rose which promises to be an acquisition to the exhibition varieties. A similar award was also given Mr. G. W. Piper for Sunrise, a variety which was the admiration of all. The Show, on the whole, was one of the most successful ever held, and reflects great credit to the Honorary Secretaries, the Rev. G. E. Jeans and Mr. E. V. Matthews, whose excellent arrangements were carried out without a hitch.

WINDSOR.—JUNE 24TH.

THE eighth annual exhibition was held during fine weather. Her Majesty the Queen visited the Show during the afternoon. The splendid group of Orchids sent by Baron Schröder of The Dell, Egham, attracted much attention from all. *Lælio-Cattleya* Lady Wigan, *Cypripedium callosum* Sanderæ, *Brassavola Digbyana*, *Odontoglossum crispum* var. Lord Sherborne, *Vanda teres*, *Bulbophyllum barbigerrum*, *Dendrobium Deari*, D. McArthur, *Lælio-Cattleya Canhamiana* and *Disa Veitchi*, with many showy *Cattleyas* and *Masdevallias*, were conspicuous. Messrs. F. Sander & Co., St. Albans, contributed new and rare plants and a few Orchids. Messrs. J. Veitch & Sons, Ltd., had a pretty display of hardy flowers and plants. Messrs. R. Wallace & Co. of Colchester had a group of hardy bulbous plants, which was very much admired by everyone. Mr. C. Turner, the Royal Nurseries, Slough, sent *Pelargoniums* and dwarf Roses in pots. Messrs. W. Cutbush & Son of Highgate, had a grand group of Carnations. Mr. H. Titt contributed bouquets of Orchids, Sweet Peas, and Roses. The local classes were very interesting.

In the open class for the Queen's cup, for forty-eight distinct, Mr. Benj. R. Cant, Colchester, was awarded first prize with fresh flowers of Helen Keller, Hon. Edith Gifford (the premier flower in the open class), Caroline Testout, Général Jacqueminot, Marchioness of Downshire (fine), Tom Wood, Ernest Metz, Capt. Hayward, Golden Gate, Mrs. J. Laing, Comtesse de Nadaillac, Dr. Sewell, Etienne Levet, Kaiserin Augusta Victoria, François Michelin, Marchioness of Dufferin, La France, Bridesmaid, Gustave Piganeau, Mrs. R. G. S. Crawford, Marechal Neil, Souvenir de S. A. Prince, A. K. Williams, Marie Verdier, Madame Cusin, Muriel Grahame, Cleopatra, Margaret Dickson, Mrs. W. J. Grant, and others. Second prize, Messrs. D. Prior & Son, Colchester, who had some very fine flowers. Third, Messrs. F. Cant & Co., Braiswick Nursery, Colchester. This stand contained a grand flower of Marchioness of Downshire, which won the silver medal. Fourth prize, Mr. George Prince, Oxford.

For eighteen Teas or Noisettes, single trusses, Mr. George Prince, Oxford, led the way with grand blooms of Comtesse de Nadaillac, Souvenir de S. A. Prince, Catherine Mermet, Marechal Niel, Maman Cochet, Souvenir d'Elise, Niphotos, Madame de Watteville, The Bride, Souvenir d'un Ami, Golden Gate (grand), Madame Hoste, Princess of Wales, Medea, White Maman Cochet, Etoile de Lyon, Madame Cusin, and Margaret Grahame. Second, Messrs. Frank Cant & Co., with good flowers. Third, Messrs. D. Prior & Son. Twelve distinct, three trusses of each.—Mr. Charles Turner was an easy first with superb flowers. Second, Messrs. D. Prior & Son. Third, Mr. B. R. Cant. Twelve single trusses, H.P. or H.T., one variety.—Mr. C. Turner was a good first with Mrs. J. Laing. Third, D. Prior & Son. Twelve single trusses of Tea or Noisette.—Second, Messrs. D. Prior & Son, with Souvenir de S. A. Prince. Third, Messrs. Frank Cant & Co., with Souvenir d'Elise.

In the amateurs' class for twenty-four distinct, single trusses, R. E. West, Esq., was first; C. Romaine, Esq., The Priory, Old Windsor, second; and P. Burnand, Esq., third. Six single trusses, one variety.—First, C. Romaine, Esq., and second, R. E. West, Esq. Twelve Teas or Noisettes, single trusses, not less than eight varieties.—First, P. Burnand, Esq.; second, C. Romaine, Esq.; and third, W. E. West, Esq. Six distinct, three of each.—First, R. E. West, Esq.; second, C. Romaine, Esq.; and third, P. Burnand, Esq.

WESTMINSTER.—JUNE 27TH.

THE Rose Show, held jointly by the National Rose Society and the Royal Horticultural Society, was held in the Drill Hall, and made a fine display, the garden Roses being especially conspicuous, and they appeared to be very popular with the visitors. There was a keen competition for twenty-four single trusses, and the adjudication gave the judges a considerable amount of trouble; ultimately Mr. B. R. Cant, Colchester, was placed first with a good even stand. The varieties were:—Back row, reading from left to right: Helen Keller, Gustave Piganeau, White Lady, Duchesse de Morny, Mrs. J. Laing, Crown Prince, Lady Mary Fitzwilliam, and Ulrich Brunner. Middle row: Dr. Sewell, Catherine Mermet, Sultan of Zanzibar, Madame de Watteville, Tom Wood, Comtesse de Nadaillac, A. K. Williams, and Madame G. Luzet. Front row: Marchioness of Downshire, Prince Arthur, Maman Cochet, Fisher Holmes, Mrs. Cocker, Dupuy Jamain, Muriel Grahame, and Mrs. W. J. Grant. Messrs. D. Prior & Son, Colchester, came second with a good exhibit. The best blooms were Gustave Piganeau, Mrs. J. Laing, Rev. A. Cheales, Caroline Testout, Helen Keller, Captain Hayward, Mrs. R. S. Crawford, Lady Mary Fitzwilliam, and La France; and Mr. F. Cant, Colchester, was third with good flowers of Gustave Piganeau, La France, Mrs. W. J. Grant, Mrs. J. Laing, and Kaiserin Augusta Victoria.

For eighteen distinct trusses (amateurs) Mr. O. G. Orpen, West Bergholt, Colchester, achieved a noteworthy success over seven competitors with a delightful exhibit. The varieties were Marquis Litta, Charlotte Guillemot, Maman Cochet, Rubens, Anna Olivier, and White Lady. Second row: Marechal Niel (grand), Mrs. W. J. Grant, Lady Mary Fitzwilliam, Charles Darwin, Souvenir d'Elise Vardon, and Horace Vernet. Front row: Rainbow, Souvenir de S. A. Prince, Captain Hayward, Danmark, Margaret Dickson, and Souvenir d'un Ami. Mr. T. B. Haywood, Woodhatch Lodge, Reigate, was placed second with charming blooms of Gustave Piganeau, Marquis Litta, Mrs. W. J. Grant, and Kaiserin Augusta Victoria; and Mr. E. M. Bethune, Denne Park, Horsham, third, with a good exhibit; the best flowers were Mad. Gabriel Luizet, Kaiserin Augusta Victoria, Caroline Testout, and La France.

For eighteen distinct trusses (open) Mr. C. Turner, Nurseries, Slough, was placed first with a heavy stand; the varieties were Mrs. J. Laing,

Gustave Piganeau, Her Majesty, Ulrich Brunner, Caroline Testout, Prince Arthur, Comtesse de Ludre, Mrs. Crawford, Xavier Olibo, Helen Keller, Maurice Bernardin, François Michelin, Mrs. Grant, Duke of Wellington, Clio, Général Jacqueminot, Antoine Rivoire, and Madame G. Luizet. Messrs. J. Burrell & Co., Cambridge, came second with a good board. The best flowers were Marquis Litta, Lady Mary Fitzwilliam, Mrs. J. Laing, Bridesmaid, and White Lady.

For twelve single trusses (amateurs) Mr. G. W. Cook, North Finchley, was first with Mrs. J. Laing, Captain Hayward, La France, Marquis Litta, Général Jacqueminot, Mrs. Crawford, Souvenir de President Carnot, Mrs. W. J. Grant, Madame Gabriel Luizet, Chas. Lefebvre, Medea, and Louis Van Houtte. Mr. W. Kingston, Bedford, was second; and Mr. R. W. Bowyer, Haileybury College, Hertford, third.

For six single trusses, Miss B. H. Langton, Hendon, was first with a beautiful exhibit; Mr. J. Bateman, Archway Road, Highgate, came second; and Mr. G. H. Blaxton, Brentwood, third. For nine trusses, one variety, Mr. P. Burnand, Reigate, was placed first with Mrs. Sharman Crawford; Mr. T. B. Hayward was second with a good stand of Mrs. J. Laing; and the Rev. Page Roberts, Scole, was third with Madame G. Luizet. For six trusses, one variety, Mr. G. W. Cook was first with Mrs. W. J. Grant; Mr. E. M. Bethune, Horsham, was second with Kaiserin Augusta Victoria.

There was a grand competition in the class for eighteen trusses of Teas and Noisettes, but Messrs. D. Prior & Son were to the fore with Innocente Pirola, Maman Cochet, Rubens, The Bride, Cleopatra, Souvenir de S. A. Prince, Catherine Mermet, Marie Van Houtte, Souvenir d'un Ami, Maréchal Niel, Madame Watteville, Caroline Kuster, Comtesse de Nadaillac, Madame Cusin, Jean Ducher, Alba Rosea, Medea, and Souvenir d'Elise. Mr. G. Prince, Oxford, was second with noteworthy examples of Comtesse de Nadaillac, Maréchal Niel, Muriel Grahame, and Bridesmaid.

For eighteen single trusses the Rev. F. Page Roberts was successful with a good even stand. The best blooms were Golden Gate, Madame Cusin, Muriel Grahame, The Bride, and Comtesse de Nadaillac. Mr. O. G. Orpen was second with Catherine Mermet, Cleopatra, Empress Alexandra of Russia, and Anna Olivier. Mr. Conway Jones, Hucclecote, Gloucester, was placed in the front rank for twelve trusses. The best blooms were Maréchal Niel, Golden Gate, The Bride, and Ethel Brownlow. The Rev. A. F. Melliar, Sproughton Rectory, Ipswich, was second. There were ten competitors for six varieties, and the first place was secured by the Rev. F. R. Burnside, St. Margaret's Bay, Dover; Mr. H. P. Landon, Shenfield, Brentwood, was second. For nine trusses, one variety, Mr. O. G. Orpen was first with good blooms of Maréchal Niel. Mr. H. P. Landon was first for six trusses, one variety, with Anna Olivier, and Mr. B. H. Langton second with the Hon. Edith Gifford.

The garden Roses made quite a show in themselves. For thirty-six varieties Messrs. G. Cooling & Sons, Bath, were placed first with a grand exhibit; Messrs. G. Paul & Son, Cheshunt, were second with a beautiful exhibit. For eighteen distinct varieties Mr. A. Tate, Leatherhead, was first with a superb exhibit; Mr. F. W. Campion, Reigate, was second; and the Rev. J. H. Pemberton third.

ROSE SHOWS.—We have been compelled, owing to pressure on our space, to keep the reports of Croydon, Richmond, and Southampton Shows until our next issue.

THE YOUNG GARDENERS' DOMAIN.

EXHIBITION VEGETABLES.

(Continued from page 520.)

POTATOES for exhibition require thorough preparation. As soon as possible after being dug the seed should be selected and placed on end in shallow boxes, with the eyes upwards, in a frost-proof place, where plenty of fresh air and light can be admitted. These must be examined occasionally, and all except two shoots rubbed off; and when required for planting, select the better of these two only. Choose a piece of ground that was well manured for a previous crop, say where Celery was grown, trench deeply, adding leaf soil and fresh lime as the work proceeds. The rows must be quite 3 feet apart for the strongest growers, and the sets may be placed 20 inches to 2 feet asunder in the rows. In some gardens the Potatoes when dug are scabby; to prevent this cover the seed with burnt garden refuse when planting. When lifting the crop select those of perfect form, carefully wash, and store in boxes in a dark place until required for the show.

Seeds of Onions for exhibition should be sown in January in boxes. When the seedlings are large enough prick out 2 inches apart into other boxes, keeping them close to the glass, in a temperature of 55° to 60°, until the growth advances, when they must be gradually hardened, and planted out 15 inches apart each way in March if the weather is favourable. Some growers pot them, instead of planting direct from boxes. If large bulbs are required for kitchen uses, or if the Onion fly is an annual trouble, the former method will be found to answer admirably, provided the ground has been thoroughly enriched and trenched 2 feet deep. Even then liquid manure from the cow stalls should be regularly applied to grow bulbs over 3 lbs. in weight.

Seeds of Cauliflowers sown at the middle of February in boxes or on hotbeds will be quite early enough for the first summer shows. But the safer way is to sow a little seed often, then if the plants form heads too early for a given date, lift them, and store in the coolest cellar at command. When the "flower" is forming, tie the leaves over the top, as by this method white heads are obtained. The site selected for the plants must

be thoroughly trenched, and decayed manure incorporated. Place the plants in rows 3 feet apart and 2½ feet asunder in the rows, giving abundance of liquid manure if obtainable. All the Brassica family require deep rich soil and similar treatment, varying the distances between the plants.

To grow good exhibition roots of Carrots and Parsnips the ground should be trenched early in the autumn, using little or no manure, this being governed by the system adopted for the previous crop. Early in March—if the soil is workable—the first opportunity should be taken to make the soil very firm, sowing the seeds without delay in the following manner. Make of wood a good model of a Parsnip, and 2 feet from the bottom attach a crosspiece, so that both feet may be used to force it into the earth. As a preliminary to this use an iron bar to make the holes, so as to facilitate the insertion of the model to the required depth. The holes should be made 15 inches apart, and the lines or rows 18 inches, and they must be filled with light rich fine soil, and two or three seeds sown in the centre of each. When these have germinated, and the plants are large enough, the best should be retained for growth. The wooden model used for the Carrots may be a size smaller, and the holes made a few inches closer together. Use the Dutch hoe frequently, particularly in dry weather.

To produce the best Leeks it is absolutely necessary to have 2 feet depth of soil thoroughly prepared and enriched by good farmyard manure. The seeds should be sown and treated in a similar way to that advocated for Onions, with the exception that it does not require to be sown so early—about a fortnight later will suffice. Some growers pot the plants, but this method cannot be general among exhibitors, room and time being too precious at the period they require repotting. When transferred to the quarter chosen, plant in lines 2 feet asunder, and 20 inches apart. Plant deeply, keeping the soil out of the crowns of plants. They may also be planted in trenches like Celery, and liquid manure liberally applied.

To produce Beet for exhibition the seeds should be sown in April, and when the seedlings appear they must be protected from frosts. The soil should be rich and well cultivated, but add no manure; this should have been given for the previous season's crop of some other vegetable. Thin the plants to 15 or 18 inches apart each way, and water thoroughly in dry weather.

Turnips require sowing at monthly intervals from the end of February (outside) on a warm border in similar soil to that advised for Beet. Choose showery weather, and if dry the drills must be watered beforehand, and these should be 15 inches apart, and the plants thinned to 1 foot asunder.—FOREMAN X.

FRUIT FORCING.

Vines.—*Early House*.—The Vines from which the Grapes have been cut must be well syringed every evening until thoroughly freed from red spider, and afterwards occasionally to preserve the old foliage as long as possible in a healthy condition, for when the leaves die early second growth not infrequently sets in when the Vines ought to be going to rest. Admit air to the fullest extent possible, and maintain a moderate degree of moisture in the border, particularly at the surface, so as to keep the roots there instead of allowing it to become dry, and so causing them to descend in quest of moisture. A moderate extension of the laterals will not do harm, but irregularities of growth, and particularly gross ones, should be checked by pinching, or be entirely removed.

Grapes Ripening.—A fair amount of atmospheric moisture should be maintained both for the benefit of the foliage and the swelling of the fruit, which enlarges considerably during the ripening process. Give the inside borders, and the outside as well if the weather be dry, a good soaking of tepid water or liquid manure, and mulch at once with about 2 inches of rather dry but short sweet litter. This will mostly be sufficient for perfecting the Grapes, but the Vines must not suffer from drought at the roots, or the berries will be liable, especially Muscats, to shrivel. Directly they begin to colour afford abundance of air, a little fire heat being essential to their higher perfection, especially in flavour, insuring a circulation of warm air, but allow the temperature to fall to 65° at night, otherwise securing by artificial means a temperature 70° to 75°, and 80° to 85° through the day for Black Hamburgs and similar varieties. Muscats should have a night temperature of 70° to 75°, 80° to 85° by day, up to 90° or 95° from sun heat.

Grapes Stoning.—The weather recently has been favourable for scorching and scalding. The best means of preventing both is a rather high night temperature, early and free ventilation by day, with a little at night. It is not advisable to close early at this critical period—the close of the stoning process, but do so carefully, and as the liability to scalding does not extend over more than a fortnight or three weeks, particular attention should be given to ventilation. If very bright weather succeed a dull moist period, a slight shade over the roof-lights is very beneficial. A double thickness of herring nets will afford all the shade required, and it is necessary, where the panes of glass are large, especially for Muscats just completing the stoning process.

Late Houses.—Thinning.—In order to secure large and highly finished berries thin them well, especially in the interior of the bunches, leaving the large berried varieties about an inch apart. Only such sorts as Gros Colman, and with the Vines in the best condition, will bear this severe thinning, therefore regard must be had to the variety, its likely ultimate size, and other circumstances, being guided by experience. The oval-berried varieties do not require so much room as the round ones, but all should be thinned, that they will have space for swelling fully without wedging, and yet be so close that when cut the bunch will retain its form. Loose bunches that show the footstalks are not so pleasing in appearance as more compact clusters, however fine the berries may be. Not only is it necessary to thin the berries, but the bunches must be reduced to the number which their size and the condition of the Vines satisfy the grower will finish satisfactorily. If an error is made, let it be on the safe side, as Vines that are over-burdened never finish the fruit well, and it is inferior in keeping qualities.

Firing and Ventilating.—It is one of the greatest mistakes to rely on solar heat alone for forwarding late Grapes. Cold nights render fires necessary; it is folly to let them out now and have to fire hard later on, when the sun has less power, to ripen the fruit. All late Grapes thrive best in a high temperature, with abundant food at the roots, and a genial condition in the atmosphere. Maintain a night temperature of 65°, and 70° to 75° by day in dull weather. Admit air early, a little at the top of the house constantly, increasing the ventilation with the temperature, allowing an advance to 85° or 90°, at which keep through the day from sun heat, reducing the ventilation with the declining sun. Close at 85°, damping the paths and borders then, and again before nightfall. It is well to close for a short time and afterwards admit a little air, which will prevent a vitiated atmosphere, and allow the foliage to dry in the morning as the sun acts on the structure. Avoid cold draughts or sudden depressions of temperature, as they cause rust.

Young Vines.—Syringe copiously in the afternoon of fine days, and close early so as to husband the sun's heat, mulching the border to keep the surface moist, affording water or liquid manure when necessary. Stop laterals to one leaf, then the sub-laterals may be allowed to extend on permanent Vines, but on supernumeraries the canes should be stopped when about 9 inches in length, the laterals at the first leaf and the sub-laterals to one joint as made, keeping them clear of the principal or cane leaves. The latter must be kept free, and allowed to die naturally, so that the buds at the base may be well formed and nourished.

THE BEE-KEEPER.

ATTENTION TO SUPERS.

THROUGHOUT the country where the chief surplus is obtained from field Beans and white Clover, the honey flow will now be at its height, but without fine weather bees cannot store a surplus. During the past three weeks bee-keepers have been favoured with bright sunshine and a high temperature. Bees have made great headway, increasing at a rapid rate. The country, however, was beginning to have a parched appearance, although the wind was in the north-east nearly the whole of the time. The wind has now veered round to the south, and with it came a heavy downpour of rain. This has been beneficial to all growing crops. Bees have received a check, but it only needs fine weather for a bountiful harvest to be stored. It is interesting to note the difference between strong and weak colonies at this season, and inspection shows the advantage of having a given number of stocks strong early in the season.

Supers placed on strong colonies at the end of May, or later, will now require attention. Already we have some perfectly finished sections, better than we have obtained for several years past so early in the season. A fair sample of run honey has also been extracted from supers. This, however, is somewhat brown in colour, as it has been obtained from field Beans. Other colonies which were left to chance are not of sufficient strength to store a surplus.

Stocks supered with a crate of twenty-one sections, and which are partly sealed over, should now be removed, and a crate of empty sections placed underneath. If the weather is dull at this season, the bees will draw out the foundation, and seal over the sections in the top super without loss of time. When a hive is crowded with bees at this date, and the sections are full of honey, the bees will prepare for swarming by forming queen cells if extra space is not provided for them. Timely attention to supers is thus necessary if full benefit is to be obtained from the bees, and this can only be done by providing room in advance of their requirements.

EXTRACTING HONEY.

We recommend all extracted honey to be obtained from supers. In our own apiary we never extract honey from the combs in the brood nest. There are, however, both a right time and a right way of extracting honey. It must never be extracted during the middle of a bright day or in the evening. Early morning is the most suitable time for the purpose. The honey obtained during the previous day will have been removed from the cells in which it was

originally placed, and after being treated by the bees will be ripened. It will then not ferment after storage in bottles, which it often does when extracted in an unripe condition.

In addition to choosing the right time of the day, it is necessary that the combs and honey be in the proper condition. The combs should be old and tough, so that they will not break down in the extractor. The honey must be partly sealed over, as we have found when honey is in this condition it is perfectly ripe, and will keep for any length of time. If early morning is not a suitable time for extracting, another crate of supers may be placed on the hive in the manner recommended for sections.—AN ENGLISH BEE-KEEPER.

- All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," 8, Rose Hill Road, Wandsworth, S.W., and NOT to 12, Mitre Court Chambers, Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor. Letters of inquiry must be accompanied by the names and addresses of the writers, but these will neither be published nor disclosed when initials or *nom de plumes* are given for the purpose of replies.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and it is convenient when each question is written on a separate sheet. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Cattleya Mendeli (J. D.).—It is rather difficult to give exact statistics as to number of flowers produced on a single spike of any kind of Orchid, as someone is almost sure to be found beating the record. Five flowers is certainly not a record number for the *C. labiata* species as a whole, whatever it may be for *C. Mendeli*; but we strongly suspect that this number has been often reached. We have had four flowers on a spike of the large flowering *C. M. grandiflora*, and should certainly not be surprised to get five from such excellent growths as yours are, by the measurements sent. We have had seven flowers on *C. gigas*, and six on *C. g. imperialis*.

Begonia Gloire de Lorraine (Puzzled).—Your plants should succeed in the soil you have potted them in if both loam and leaf soil are of the right kind. The probabilities are that your loam is not good. The right kind for this Begonia is good fibrous, mellow, rather light loam, which pulls to pieces easily, and does not form hard lumps when dry. The leaf soil should be only half decayed, perfectly sweet, and be rubbed through a half-inch sieve. Procure loam and leaf soil of the above description, and form a compost of two parts of the former to one of the latter, adding the usual amount of sharp sand and a few lumps of charcoal. Shake the plants out, repot, and grow in an intermediate house, syringing freely till good progress is made, after that only occasionally. If you cannot procure good loam pot entirely in peat, such as Ferns thrive in. A stove temperature is too hot in summer time. You will have no difficulty in succeeding if you follow this treatment.

Discoloured Leaves of Chrysanthemums (Dunkeld).—The leaves are affected with eelworm, *Tylenchus devastatrix*, and by the mycelium of some fungus. It may not have anything to do with the discolouring of the leaves, but is only a consequence of the eelworm attack, this being accompanied by bacterial organisms, causing the clamminess on the destroyed parts. The best treatment under such circumstances is to spray, using an atomiser, with methylated spirit diluted with an equal part of water. The spirit sinks more or less into the affected parts, and destroys the fungoid hyphae as well as the eelworm. Good results also follow syringing with nicotine essence, one part in ninety-six parts water. The thing is to act promptly and give the plants more mineral food, they being very succulent in foliage and deficient in lime. A little superphosphate, three parts, and two parts kainit mixed would do good, using a pinch between the finger and thumb per 10-inch pot, and washing in, or preferably mixed with an equal quantity of soil, sprinkling in after watering. If desired the mixture may be used in liquid form, half an ounce to a gallon of water, and supplied at every alternate watering, or about twice a week for a time.

White "Fungus" on Apple Trees (York).—It is just possible that what you describe as a "white fungus" may be the American blight, the presence of which is indicated by white fluffy masses on the stems. It can be cleaned off with methylated spirit applied with a brush, carbolic soap solution, petroleum emulsion, or Gishurst compound. Perhaps you had better send specimens of the infestation as soon as you read this reply.

Destroying Apple Chermes (D. R.).—The most efficacious wash for the destruction of this pest is one containing sulphuret of lime. This may be made by combining the sulphuret with water, or more conveniently by boiling together sulphur and lime in the proportion of 1 lb. of sulphur and 2 lbs. of lime to 4 gallons of water. Tobacco water also kills them, with or without the addition of Gishurst compound, but the difficulty is to reach the insects, secluded as they are in the blossoms. In fact, not much can be done during the spring, and the time for the destruction of chermes is the winter. Those which are to be the parents of the new brood lodge within cracks of the bark, angles and ridges of twigs, and the like places of shelter, where, however, they may be reached and killed by copious syringing with a hot solution of softsoap.

The Tiger Moth (W. Raby).—The caterpillar you send for identification is that of the tiger moth (fig. 122), which is scientifically known as *Chelonia Caja*. It is one of the commonest caterpillars both in gardens and uncultivated places, its favourite food plants in the latter spots being Docks and Dead Nettles. In the garden it appears most partial to the vegetable quarters, but sometimes appears on the flower beds, and may

FIG. 122.—THE TIGER MOTH.

even be detected feasting on fruit trees or disfiguring a choice *Pelargonium*. The moth has acquired its tigrine name from the markings of the upper wings, which are usually adorned with blue-black spots on a red ground. The head and legs of the caterpillar are black, and the body is covered with long silky hairs.

Names of Plants.—We only undertake to name *species* of cultivated plants, not wild flowers, or varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in securely tied firm boxes. Thin paper boxes arrive in a flattened state. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool or paper the worst. Those arrive in the best condition that are so closely or firmly packed in soft green fresh grass, as to remain unmoved by shaking. No specimens should be sent to rest in the post office over Sunday, on which day there is no delivery of postal matter in London. Specimens in partially filled boxes are invariably injured or spoiled by being dashed to and fro in transit. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (J. O. H.).—1, specimen insufficient, an *Aralia*, probably *leptophylla*; 2, *Aralia Veitchi*; 3, *Sobralia macrantha*. (W. B. R.).—Brilliantly coloured specimens of the Copper Austrian Briar. (T. S.).—1, *Cercis siliquastrum*; 2, *Salisburia adiantifolia*; 3, *Abies Douglasi*. (P. L.).—1, *Viburnum plicatum*; 2, *Hemerocallis flava*; 3, *Cerastium tomentosum*; 4, *Sambucus aurea variegata*; 5, *Salvia argentea*. (C. G. M.).—1, *Selaginella Wildenovi*; 2, *Pteris umbrosa*; 3, *Adiantum trapeziforme*; 4, *Asplenium viviparum*; 5, *Nephrolepis davallioides furcans*; 6, *Woodwardia radicans*. (C. A.).—*Pelargoniums* are florists' flowers, which we cannot undertake to name; send specimens to some large grower, who will name them by comparison. (J. H.).—1, *Masdevallia Davisii*; 2, *M. Lindenii*; 3, *M. ignea*; 4, *M. Harryana*. The small *Odontoglossum* is a very poor form of *Rossi*. *Zephyranthes carinata*. (J. S. U.).—1, *Lithospermum purpureo-cerulea*; 2, *Anemone dichotoma*. (Single W.).—1, *Sisyrinchium striatum*; 2, *Spiraea ulmaria fl.-pl.*; 3, *Centranthus ruber*; 4, *Nigella damascena*. (S. N.).—1, *Tasconia Van-Volkemi*; 2, *Rhynchospermum jasminoides*; 3, *Habrothamnus elegans*; 4, flowers withered; we are endeavouring to expand one of the later buds; 5, *Hoya bella*. (F. S.).—1, *Kerria japonica flore-pleno*; 2, Yellow Austrian Briar; 3, *Genista hispanica*; all excellent specimens.

Bedding out plants in variety from 3s. doz.

AGRICULTURAL RETURNS FOR 1898.

TRUTH lies at the bottom of a deep well, and is therefore a most difficult thing to get at. It is not that people mean to prevaricate. No, not at all, but they are apt to look at things through their own spectacles, and their own spectacles so often distort.

Dine at a market ordinary on a busy day, lay yourself out to gather information from the various farmers present. Every class will be represented—the gentleman farmer, who is combining pleasure with

business; the noted breeder of some special line of stock; the man given over to Potatoes and Wheat, and the smaller farmer whose sons probably stand in as labourers, and whose daughters make dairy work and poultry rearing a ready means to pay all the household bills. Question these men on their prospects, or rather on the general prospects of the neighbourhood, and you will be astonished at the diversity of their answers. Possibly all will have a bit of a grumble, but as their various holdings are essentially dissimilar, so will be their views of the situation.

To arrive at a right estimate of things in general, there is nothing that will beat Government statistics. They cover a wide range, in fact all the range, and are compiled from reliable sources, and there is no bias either one way or the other.

What 1899 will show as regards a Wheat area we are not in a position to tell, but we cannot be surprised that the improvement in the price of Wheat caused a very much increased acreage to be sown in 1898. In the last quarter of 1897 the price of Wheat was 33s. 3l., in the first quarter of 1898 35s. 1d. as against a yearly average ranging in 1893-96 from 22s. 10d. to 26s. 4d. We began to hope at last the tide had turned, and so we find that 213,000 acres, or 11·3 per cent. were sown additionally. In 1895 we had gone to our lowest point, we are now getting into a more normal state. The greatest increase has been in Lincolnshire and the North Riding of Yorkshire. As a good deal of spring Wheat was put in, of course there was less available acreage for Barley, and very little bare fallow was to be found at all.

We do not quite understand the reason for the falling off in horse breeding. Is it because we find it cheaper to import than to breed, or do we fail to breed the right sort? We fancy too many farmers are so living, as it were, from hand to mouth, that they dare not risk anything in so precarious a vocation. At any rate, we are 4400 short on last year, that is for unbroken young horses. We do not quite like this. Hitherto we have considered our English hunters, coach, hackney, and Shires as the pick of the markets, and we are very loth to hear of the supremacy of the foreigner. Why is it we are relinquishing, one by one, our specialities?

However, if horse breeding appears to have received a check, the same cannot be said of horned cattle. The increase is very marked—namely, 122,000. But we have not yet risen to the numbers in 1871-75. Then the proportion was 134 for every 1000 inhabitants; in 1897 it was 112 for every 1000; now it is 113 for every 1000. There are more cows than in any year since 1892, and this is a most hopeful sign, in face of all the scare of tuberculosis. We now estimate there are seventy-three cows to supply milk for each set of 1000 people.

Sheep are looking up again, with an increase of 403,000. In 1891-92 they appear to have reached their highest point. Since 1895 the flocks of breeding ewes have been steadily increasing, and this in the face of the tons of frozen mutton and lamb from abroad.

The landlord, too, has entered on to better times—at least so we judge, when we find the landlords, as a body, are farming only $4\frac{1}{2}$ millions of acres out of $32\frac{1}{2}$ millions. It is, we fancy, an easier thing to receive rents than to make them, especially when so much of the profit has to go out in payment to overlookers and bailiffs. We do not wish to hint that these men are overpaid, but farming will not stand any extra expense, and the tenant or landlord, as the case may be, should be his own manager.

There is one item we are very sorry to see, and that is the immense Barley bill—£24,800,000 for Barley!—and our own Barley land going out of cultivation. There is something rotten in the state of England, my masters, if this be the case. Of course this is not all malting Barley, there must be thousands of tons of small thin stuff of inferior foreign quality used for feeding purposes, possibly used in a great measure in corn cakes.

The import of Maize, too, is on the increase, but as a set off we find that we have imported 160,000 tons less butter, 13,000 tons less cheese, and less margarine and eggs, 45,000 tons instead of 65,000 in 1892. We begin to think the preachers have not altogether preached

in vain if our national supply of butter is on the increase; it means, too, that it must be of a better quality, and that is a pleasant and good sign.

For fruit, vegetables, and dead meat our bill with the foreigner amounts to £141,000,000. What a hungry people we are! The best customers in the world, and paying with good solid English sovereigns. It must be a sign of national prosperity, as the stomach generally feels the first pinch when times are hard. We cannot forget the Barley bill, we do not like it; and we should be glad if wiser heads than ours could suggest some remedy. We find no fault with importations that we cannot produce; but this is a different question; we have the land, we have the men, and we ask only for a living profit.

WORK ON THE HOME FARM.

We have had a splendid rain at last, and the troubles of the strong land farmer are somewhat palliated, if not altogether removed.

The later Turnips can now be put in with a fair prospect; the land is both warm and moist, and Turnips sown at once should be quickly up. We are sorry to say that many fields have been visited by the fly, and the land which it was hoped would produce a fine crop of Swedes will have to be resown with common Turnips.

This, besides entailing more labour, is a serious loss, for the Swedes will be much missed, both in the stockyard and by the feeding sheep, whilst if there should be a severe winter the white-fleshed Turnips may soon be rendered absolutely useless. Potatoes are growing very quickly, and the earthing-up process is very much improved by the rain. Lately the soil has been so dry that it would not remain up, but fell back into the furrow. This portion of the field must be done over again, as we like to see Potatoes well earthed up.

The rain, which is so welcome everywhere else, is inopportune for the many farmers who now have their hay down. Fortunately the rainfall has come all at once without any drying intervals, so perhaps not much harm will have been done. The crop is not a large one, but is good in quality, so it would be a great pity if it were spoilt; besides, as Swedes may be scarce articles, the hay crop will become of still greater importance. Mangolds have grown very well where it has been possible to keep a loose surface; they should now be quite safe, and be the root crop of the season.

Wheat is rapidly coming into ear, and looks very well everywhere, but both Barley and Oats are hardly so satisfactory as they should be. Some fields of ideal and well farmed Barley soil look well, but many pieces of strong, or even only approaching strong land have done very little during the last three weeks, and barely hide the ground from view. Whether they can recover seems to be very dubious, and Barleys must be deficient both in quantity and quality. Oats, too, will be short in the straw, and that always means light of grain. Pastures are very bare, but stock has done well.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

- 18th.—Sunshine all morning, generally cloudy in afternoon, rain from 8 P.M. to midnight.
 19th.—Alternate cloud and sun in morning; generally cloudy after noon.
 20th.—Rain from 0 A.M. to 4 A.M., and overcast and showery to 10 A.M., then generally cloudy till 4 P.M., and bright after.
 21st.—Overcast early, cloudy morning, generally bright from 1 P.M.
 22nd.—Overcast early, sprinkles of rain from 10 A.M., steady rain from 0.30 to 3.30 P.M., and showers later.
 23rd.—Overcast throughout but for a gleam of sun at noon.
 24th.—Overcast morning, sunny afternoon.
 A fine week, but with a little very welcome rain.—G. J. SYMONS.
